Acta Crystallographica Section E: Structure Reports Online is the IUCr's highly popular open-access structural journal. It provides a simple and easily accessible publication mechanism for the growing number of inorganic, metal-organic and organic crystal structure determinations. The electronic submission, validation, refereeing and publication facilities of the journal ensure very rapid and high-quality publication, whilst key indicators and validation reports provide measures of structural reliability. In 2007, the journal published over 5000 structures. The average publication time is less than one month.

Received 24 July 2009; accepted 8 October 2009

Key indicators: single-crystal X-ray study; T = 153 K; mean  $\sigma(Ba-Br) = 0.0014$  Å; disorder in main residue; R factor = 0.015; wR factor = 0.033; data-to-parameter ratio = 20.5.

Single crystals of Ba<sub>0.96</sub>Eu<sub>0.04</sub>BrI (barium europium bromide iodide) were grown by the Bridgman technique. The title compound adopts the ordered PbCl<sub>2</sub> structure [Braekken (1932). *Z. Kristallogr.* **83**, 222–282]. All atoms occupy the fourfold special positions (4c, site symmetry m) of the space group *Pnma* with a statistical distribution of Ba and Eu. They lie on the mirror planes, perpendicular to the b axis at  $y = \pm 0.25$ . Each cation is coordinated by nine anions in a tricapped trigonal prismatic arrangement.

### **Europium-doped barium bromide iodide**

## G. Gundiah, S. M. Hanrahan, F. J. Hollander and E. D. Bourret-Courchesne

#### Comment

Barium mixed halides activated by Eu<sup>2+</sup> have been extensively studied as X-ray phosphors (Schweizer, 2001; Crawford & Brixner, 1991) and scintillators for the detection of γ-rays (Selling *et al.*, 2007). The F-based compounds of the form BaFX (*X*= Cl, Br, I) have a tetragonal, matlockite structure similar to PbFCl (Liebich & Nicollin, 1977). Among the other barium mixed halides, the structure of BaBrCl has been found to be the PbCl<sub>2</sub>-type (Hodorowicz *et al.*, 1983). Lenus *et al.* recently solved the structures of BaBrI and BaClI from X-ray powder diffraction data in the space groups *P222*<sub>1</sub> and *Pbam* respectively (Lenus *et al.*, 2002). We have synthesized single crystals of Ba<sub>0.96</sub>Eu<sub>0.04</sub>BrI and present details of the structure. Eu is introduced as a dopant and substitute for Ba. The doping was not expected to change the structure of the parent material BaBrI. However, we determine the structure to have a space group *Pnma*, similar to that of isomorphous compounds EuBrI (Liao *et al.*, 2004) and SrBrI (Hodorowicz & Eick, 1983), but not the structure published by Lenus *et al.* for powders of BaBrI (Lenus *et al.*, 2002)

The title compound adopts the orthorhombic PbCl<sub>2</sub> structure. All atoms occupy the fourfold special positions (4c) of the space group  $D^{16}{}_{2h}$ -Pnma. They lie on the mirror planes, perpendicular to the b axis at  $y = (\pm)0.25$ . Each Ba/Eu cation is coordinated by 9 anions in a tricapped trigonal prismatic arrangement (Fig. 1). The anions are not equidistant from the Ba cation but present in two different positions. The smaller bromide anions occupy one of the anionic positions at distances between 3.26 and 3.30 Å. The larger iodide anions occupy the second anionic position (distances 3.62 - 3.71 Å), giving a completely ordered structure for the anions. The same ordering has been observed in isomorphous compounds EuBrI (Liao et al., 2004) and SrBrI (Hodorowicz & Eick, 1983).

The Eu content of 4% has been determined from the refinement of the structure. The presence of divalent Eu is also confirmed by measuring the emission curve under X-ray excitation. The characteristic  $4f^65$   $d^1 \rightarrow 4f^7$  transition of Eu<sup>2+</sup> was observed. A detailed study of the luminescent properties is currently underway and will be presented in a future publication (Bourret-Courchesne *et al.*, 2009).

#### **Experimental**

Single crystals with the composition  $Ba_{0.96}Eu_{0.04}BrI$  were grown by the vertical Bridgman techniques.  $BaBr_2$ ,  $BaI_2$ ,  $EuBr_2$  and  $EuI_2$  were obtained commerically, mixed in the molar ratio 0.48: 0.48: 0.02: 0.02 and sealed in a quartz ampoule under a dynamic vacuum of 1.10  $^{-6}$  Torr. The sealed ampoule, about 1 cm in diameter, was heated in a 24 zone Mellen furnace to a temperature of 1123 K and directionally cooled to provide a growth rate of 1 mm/hour. The reactants and products are moisture-sensitive and all manipulations were carried out inside an Argon-filled glove box. The crystal obtained is colorless.

#### Refinement

The doping of Eu(ii) on the Ba(ii) site was modeled with a fractional Eu atom fixed in the same location and with the same thermal parameters as the Ba(ii) atom. The relative occupancy factor refined to 0.963 (13) Ba, 0.037 (13) Eu.

#### Data collection

Bruker SMART 1000 CCD diffractometer

Radiation source: fine-focus sealed tube

Monochromator: graphite

Detector resolution: 8.192 pixels mm<sup>-1</sup> T = 153 K T = 153 K

T=153 K  $\theta_{\min}=3.1^{\circ}$   $\varphi$  and  $\omega$  scans  $h=-9 \rightarrow 10$ Absorption correction: multi-scan (Blessing, 1995)  $k=-6 \rightarrow 5$  $T_{\min}=0.128, T_{\max}=0.316$   $l=-11 \rightarrow 11$ 

Refinement

2609 measured reflections

Refinement on  $F^2$  Primary atom site location: heavy-atom method

Least-squares matrix: full	$w = 1/[\sigma^{2}(F_{o}^{2}) + (0.02P)^{2}]$ where $P = (F_{o}^{2} + 2F_{c}^{2})/3$
$R[F^2 > 2\sigma(F^2)] = 0.015$	$(\Delta/\sigma)_{\text{max}} = 0.001$
$wR(F^2) = 0.033$	$\Delta \rho_{max} = 0.89 \text{ e Å}^{-3}$
S = 1.02	$\Delta \rho_{min} = -0.78 \text{ e Å}^{-3}$
430 reflections	Extinction correction: SHELXL97 (Sheldrick, 2008), $Fc^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
21 parameters	Extinction coefficient: 0.0151 (5)

#### Special details

**Geometry**. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.

The doping of Eu(ii) on the Ba(ii) site was modeled with a fractional Eu atom fixed in the same location and with the same thermal parameters as the Ba(ii) atom. The relative occupancy factor refined to 0.963 (13) Ba, 0.037 (13) Eu.
