Reforestation as a Forest Carbon Project: An Outreach Toolkit for Conservation Organizations and Landowners

Katherine Goslee, Leslie Bryan, Bob Ryneanson, Nicholas Martin

TABLE OF CONTENTS

INTRODUCTION	2
WESTCARB OUTREACH EFFORTS IN SHASTA COUNTY, CA.....	3
FOREST CARBON: BASICS OF TERRESTRIAL OFFSET PROJECTS	31
PROJECT EXAMPLES: PILOT REFORESTATION PROJECTS IN SHASTA COUNTY, CA	54
DEVELOPING AND REGISTERING A FOREST CARBON PROJECT IN NORTHERN CALIFORNIA	125
REFORESTATION: A CASE STUDY OF REGISTRATION UNDER THE CLIMATE ACTION RESERVE (CAR).....	159

INTRODUCTION

This toolkit includes a series of presentations that can be used for educational purposes to describe the basics of forest carbon projects. These presentations were developed as a result of years of experience working on forest carbon projects domestically and internationally, and in particular, from experience working in Shasta County as a part of the WESTCARB project. Much of the information they contain is the result of lessons learned in Shasta County.

The presentations are intended to give an overview and provide a basic foundation of knowledge; they are not intended to prepare individuals to develop a forest carbon project from start to finish. If individuals or organizations have further interest in learning about or pursuing a forest carbon project, they should contact a forester, project developer or other specialist who has detailed knowledge of and experience in terrestrial carbon projects and markets.

The following presentations are included in this toolkit:

1. WESTCARB Outreach Efforts in Shasta County, CA
2. Forest Carbon: Basics of Terrestrial Offset Projects
3. Project Examples: Pilot Reforestation Projects in Shasta County, CA
4. Developing and Registering a Forest Carbon Project in Northern California
5. Reforestation: A Case Study of Registration under the Climate Action Reserve (CAR)

The presentations are included here for reference, along with notes as appropriate. Each presentation is also available as a PowerPoint document.

For more information, please contact

Multiple Audiences

- Landowners
- Land Managers
- General Public
- Local Government
- Agencies
- Local and Regional Organizations
- Environmental Advocates
- Education Community

Outreach efforts were directed at various audiences, which included local and regional agencies, organizations, and individuals. While messages were consistent, they needed to be tailored to the audience's understanding and background.

Slide 3

Initial Outreach

- Stakeholder Meeting
- More than 400 Landowners Contacted Through Letters Sent to Landowners With 100+ Acres in Priority Areas
- Presentations at Local and Regional Meetings
- Word of Mouth

To elicit interest, a stakeholder meeting was held, and scoping letters sent to targeted landowners. These activities were followed up with presentations to multiple interests.

Slide 5

OK, Maybe I'm Interested... Survey Me!

- + 50 Landowners Interested & Interviewed
 - o Willingness
 - o Cost-sharing
 - o Site Conditions
 - o Acres
 - o Species Preferences

More than 50 landowners were formally surveyed for the purpose of identifying types of landowners who may be interested in committing themselves to future participation in climate mitigation forest plantation programs, to understand the conditions which landowners might be interested, and to identify sites to perform site evaluations.

Slide 6

Formal Surveys

Shasta County Landowner Willingness to Participate Survey																									
Interview name: _____ Date of interview: _____ This section to be completed before the interview: Landowner name: _____ Site identifier: (ICD) to use their own discretion to precisely identify the parcel(s) the owner(s) will discuss during the interview. Land holding size: _____ acres Ownership status: _____ Family-owned (A) _____ Absentee part-time occupant (B) _____ Full-time occupant, first-generation (C)																									
Following information to be collected during the interview:																									
<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 50%;">Question</th> <th style="width: 50%;">Response</th> </tr> </thead> <tbody> <tr> <td>1. Confirm parcel information noted above, correct as needed.</td> <td></td> </tr> <tr> <td>2. What would you need in order to be willing to plant additional lands to trees on your land?</td> <td> Circle all that apply: A. Nothing needed, plan to do anyway B. Cost-sharing for planting cost C. Cost-sharing for planting and maintenance cost D. Cost-sharing for irrigation, tree purchase systems, or associated costs from project E. Opportunity to market wood products from project F. Opportunity to market carbon credits from project G. Knowledge H. Additional information I. Other: _____ </td> </tr> <tr> <td>3. If cost-sharing is required, what level of cost-sharing would you require?</td> <td> _____ \$ per acre or _____ % of total cost </td> </tr> <tr> <td>4. New Federal or state regulations E. Increased land management costs F. Other (list here)	11. Please feel free to add any other comments.	Record landowner's comments or concerns.
Question	Response																								
1. Confirm parcel information noted above, correct as needed.																									
2. What would you need in order to be willing to plant additional lands to trees on your land?	Circle all that apply: A. Nothing needed, plan to do anyway B. Cost-sharing for planting cost C. Cost-sharing for planting and maintenance cost D. Cost-sharing for irrigation, tree purchase systems, or associated costs from project E. Opportunity to market wood products from project F. Opportunity to market carbon credits from project G. Knowledge H. Additional information I. Other: _____																								
3. If cost-sharing is required, what level of cost-sharing would you require?	_____ \$ per acre or _____ % of total cost																								
4. If providing specialized advice was provided (e.g. cost-sharing information, seedlings, etc.) how much land would you potentially be willing to plant with trees?	_____ acres or _____ % of total holding																								
5. Willingness to participate in annual phone assessments and 2 page survey for 10 years.	Yes or No																								
6. Landowner Objectives	Record landowner objectives in rough order of priority: A. Income production B. Aesthetics C. Recreation D. Timber production E. Historical F. Other (list here)																								
7. If interested and prepared to do so, can you designate which portion of your land you would be willing to plant? (OPTIONAL)	(This question should only be asked if the landowner is strongly interested and ready to designate on the map of their landholding specific areas/vegetation types they would be willing to plant. Otherwise, this map can be done in a follow-up meeting with interested landowners.) Record any site description information available such as accessibility, slope, existing vegetation, etc.																								
8. What is the current state of the proposed site?																									
9. Which tree species would you most like to plant on your land?	Circle all that apply: A. Commercial hardwoods B. Commercial softwoods C. Mixed hardwood/softwoods D. Non-commercial hardwoods E. Non-commercial softwoods F. Diverse species to improve wildlife, habitat and privacy G. No preference H. Not sure I. These species (list here)																								
10. What concerns do you have about tree planting on your property?	Circle all that apply: A. No Concerns B. Increased fire risk C. Increased fire risk D. New Federal or state regulations E. Increased land management costs F. Other (list here)																								
11. Please feel free to add any other comments.	Record landowner's comments or concerns.																								

Surveys were performed over the telephone and in person. The survey included questions such as what assistance (technical, material, or financial) was needed by the landowner, what their objectives were for their property, what the proposed planting site was like currently (accessibility, slope, existing vegetation, legal description etc.), what species of trees were preferred, and what concerns the landowner had (if any) regarding planting trees on their property.

Slide 7

Landowner Outreach

- +50 interest surveys resulting in majority desk review for consideration
- 20 site visits resulting in 17 plans
- Contract negotiations including amendments adding additional acreage, revising herbicide prescription and extending agreements
- Measuring, site prep, planting, and monitoring activities
- Scheduling field trips and interviews
- Project updates individually and via landowner meetings

Ongoing communication with participating landowners was necessary throughout the project period from project selection through project implementation and monitoring.

Slide 8

**Involved Discussion: Site Visits,
Telephone, Email**

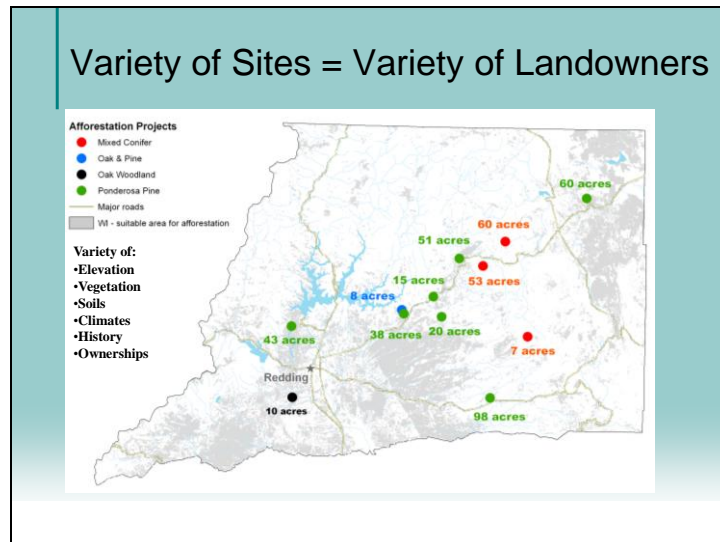

How much will it cost? What's it going to look like?

What will it look like 5, 10, 50+ years from now?

What's a carbon credit?

Each step in the process elicited additional questions and discussion. Time necessary for each landowner contact varied depending on landowner knowledge and interest. Significant time was allotted for landowner contact, especially during the time landowners were deciding if they would participate in a project.

Slide 9

Projects varied in location, size, and ownership type (ex. family-owned, resident, absentee, timber producer, homestead, mixed conifer, oak woodland etc.).

Slide 10

Landowner Education

- Climate Change
- Forestry 101
 - Site Conditions
 - Species
 - Site Prep
 - Herbicides
 - Maintenance

Type of information and education requested varied depending on landowner. Landowners not familiar with forestry practices required different efforts than those knowledgeable in forest practices. Landowners provided information valuable for project planning and development.

Slide 11

Throughout project implementation, communication between landowner, forester and contractor was vital. Open consistent communication helped develop good working relationships and common understanding.

Slide 12

Community Outreach

- Local/Regional Meetings
- County Fairs and Festivals
- WSRCD Website
- Newsletter Articles
- Newspaper Articles
- Prairie Public PBS Documentary
- Natural Resource Conservation Service Success Story

Outreach to the community was performed consistently through multiple venues.

Slide 13

Local and Regional Government and Organizations

- County Board of Supervisors
- City Council
- Electric Utilities
- Fire Safe Councils
- Local Forest Education Council
- Watershed Groups
- Local and Regional Land Management and Conservation Organizations

Presentations were made to a variety of groups and included land management, conservation, and economic interests.

Slide 14

Each Landowner/Group is Unique

- Values
- Understanding of Natural Systems
- Concerns
- Goals

Slide 15

Challenges

- “Us against them” mentality
- Language barriers
- Passed down beliefs
- Landowners - Individual ownership / family trust
- Time investment

Slide 16

Traditional venues such as meetings and interviews were useful to get the word out.

Slide 17

Print media such as newsletters and newspapers were also used.

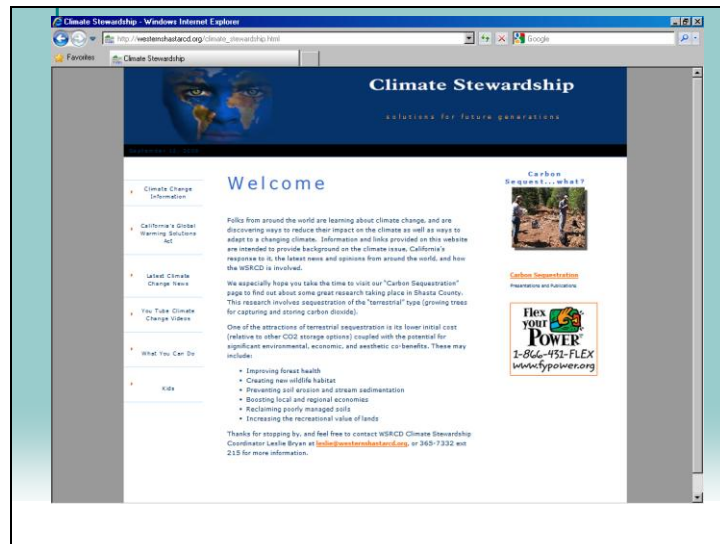

Slide 18

Non-Traditional Outreach “The Times They Are A Changing”~ Bob Dylan

- Website
- Festivals – Video Contests
- You Tube
- Facebook
- Webzines
- Blogs

Today there are many additional outreach venues available that can be used to reach multiple and diverse audiences.

Slide 19

Websites are a great tool to educate, and begin conversations. Links to non-biased information was welcomed by visitors.

Slide 20

2009 Whole Earth Festival & Watershed Festival

Celebrating Earth Day I
Saturday April 25, 2009
Redding City Hall and Sculpture Park
10am to 3pm

Free Admission!

Over 60 Exhibitors, great food, live music, interactive presentations, a recycled Art Show, children and youth activities including a Watershed Passport and Student Video Contest !!

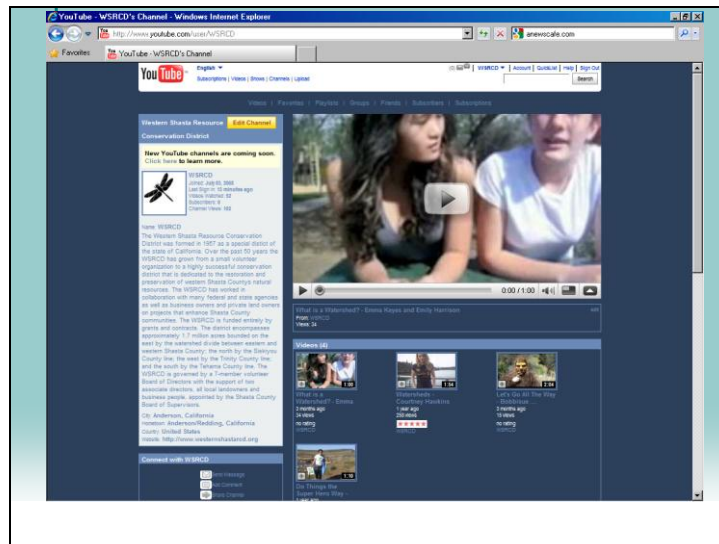

www.seancplanet.org

2009 Whole Earth and Watershed Festival Event Schedule

8:00am	Site opens for Exhibitors and Vendors
9:45am	Exhibitors and Vendors are ready for the public
10:00am	Main Stage: Whole Earth and Watershed Festival Opening Ceremony
10:15am	Main Stage: Frank Meek, Meeks Lumber
10:30am	Community Room: Documentary Film: "The Bounty of Marin"
11:30am	Community Room: Meet your Local Farmer
11:30am	Main Stage: Jeff Lewis, Shasta College: "Sustainability"
12:00pm	Main Stage: Live Music begins
1pm	Community Room: Documentary Film: "State of Resolve: California Environmental Law"
1:30pm	Main Stage: Dr. Raymond L. John "Animal Recycling: The Role of Haven Humane"
1:45pm	Community Room: Student Video Contest Viewing
2pm	Community Room: Documentary Film: "Out of the Air-Into the Soil: Land Practices That Reduce Atmospheric Carbon Levels"
2:30pm	Main Stage: Shasta Conservation Fund Awards and Student Video Awards
3pm	2009 Whole Earth and Watershed Festival Closing

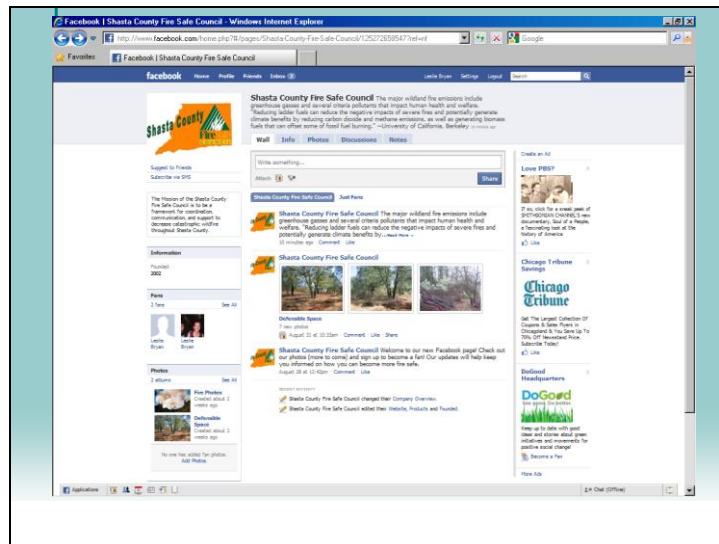

Educational presentations and activities were included in local festival programming.

Slide 21

Video contests were held to engage local youth in the topics of climate change and carbon sequestration.

Slide 22

The currently popular social media network Facebook was used for outreach in collaboration with the county Fire Safe Council.

Slide 23

Webzines proved to be an increasingly popular avenue for getting the word out.

Slide 24

Education Community

- Community College
- ROP and Environmental Education Advisory Groups
- Local Museums
- Forest Foundation's Talk About Trees Program
- American Forest Foundation's "Project Learning Tree" Program

Multiple educational resources have existing curriculum and/or are available to collaborate on community education and involvement.

Slide 25

Common Issues Important To Landowners/Community

- Privacy
- Government Involvement
- Restrictions
- **Ecosystem Integrity**

The slide features two photographs. The left photograph shows a landscape with sparse, dry vegetation and a dirt path, suggesting a degraded or recovering ecosystem. The right photograph shows a forest with tall trees and a dirt path, representing a healthy ecosystem.

While many landowners and community members have concerns that make them wary of participating in organized programs, they also wish to maintain healthy ecosystems in their community. This presents an opportunity for opening discussion and recognizing common goals.

Slide 26

Increasing Interest

- Biomass/Fire Safety (Maintenance)
- Reducing Footprint
- Carbon Markets
- Climate Stewardship Partnership
- Education

Interest in terrestrial sequestration is increasing by a diverse variety of groups/types of people (individuals, organizations, foresters, utility companies, watershed groups, fire safe councils, education community and others...)

Slide 27

Message and Motto:
“Listen” and “All Together Now”
~ *Beatles*

- Tailor Message to Audience
- Develop Relationships
- Be open to mutual conversation
- Invest time for project success and ongoing far into the future for sustainability

Successful outreach includes open two-way conversations. Significant time should be invested to develop and nurture positive working relationships which are vital for project implementation and sustainability.

Slide 28

Thank you for your interest in educating and involving landowners and community members in terrestrial sequestration. Feel free to contact the Western Shasta Resource Conservation District for more information. 530.365.7332, wsrcd@westernshastarc.org. Visit the Climate Stewardship page at http://westernshastarc.org/climate_stewardship.html.

FOREST CARBON: BASICS OF TERRESTRIAL OFFSET PROJECTS

Slide 1

WEST
COAST
REGIONAL
CARBON
SEQUESTRATION
PARTNERSHIP
westcarb.org

Forest Carbon

**Basics of Terrestrial
Offset Projects**

Wi WINROCK
INTERNATIONAL

Slide 2

The carbon cycle describes the movement of carbon between different reservoirs or sinks. The main sinks are the atmosphere (where carbon is stored as carbon dioxide); the terrestrial biosphere (including plants, soil, and freshwater); the oceans; and the sediments, including fossil fuels. Carbon is naturally released into the atmosphere in many ways, but human activities such as fossil fuel use and deforestation can accelerate this process.

In the above diagram, blue arrows represent natural movement of carbon between sinks, and red arrows represent movement caused by human activities. The numbers are gigatons of carbon, or billion metric tons.

Focus on emission from fossil fuels vs. emissions from changing land use (1.6 vs. 6.3) – changing land use is about 25% of fossil fuel emissions so important to focus on

Slide 3

Changes in land management activities to increase stored carbon (such as tree planting) can help to offset some emissions from fossil fuel use.

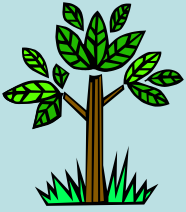

Slide 4

Carbon

- Carbon is a part of all living and dead biomass
- Biomass pools are comprised of consistent proportions of carbon (~50%)
- Carbon can be accurately estimated by establishing the mass of organic material

Slide 5

Carbon = $\frac{1}{2}$ Biomass (Dry Weight)

For example:
4 tons Biomass →
2 tons Carbon

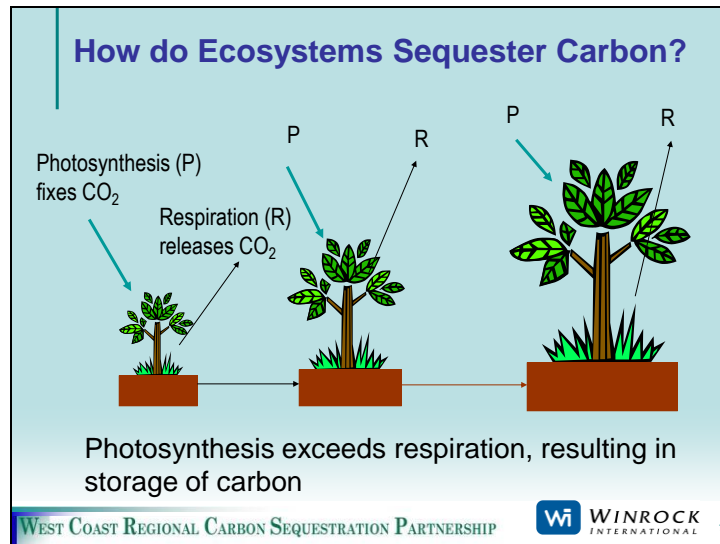

WEST COAST REGIONAL CARBON SEQUESTRATION PARTNERSHIP  5

Slide 6

Carbon Dioxide (CO₂)

- Carbon dioxide is a greenhouse gas comprised of carbon and oxygen
- Trees use CO₂ during photosynthesis, releasing oxygen and storing carbon.
- The amount of carbon in a tree can be converted to CO₂ by multiplying by 44/12 or 3.67.

Slide 7

Slide 8

What is a Terrestrial Carbon Sequestration Project?

- Activity focused on ecosystems resulting in less greenhouse gases (primarily CO₂) in the atmosphere
 - Avoid new emissions
 - Remove CO₂ from the atmosphere
- Project-based carbon benefits are the difference between the selected “carbon pools” in the with-project and without-project cases

Slide 9

Forestry Practices that Sequester or Preserve Carbon

- Afforestation: tree planting on lands previously not in forest
- Reforestation: tree planting on previous forest lands
- Forest preservation or avoided deforestation: protection of threatened forest lands
- Forest management: modification of management practices

Slide 10

Where is Carbon Sequestered?

- Live biomass
 - Trees
 - Understory
 - Roots
- Dead biomass
 - Standing
 - Down
 - Coarse
 - Fine
- Wood products
- Soil

“Carbon Pools”

WEST COAST REGIONAL CARBON SEQUESTRATION PARTNERSHIP  WINROCK INTERNATIONAL ¹⁰

Slide 11

Slide 12

Slide 13

Carbon Pools

- Selection of pools depends on:
 - Expected rate of change
 - Expected magnitude and direction of change
 - Availability of methods, accuracy and cost of methods to measure and monitor
- For A/R, REDD:
 - Always measure AG+BG biomass
 - Other pools: dependent on project

WEST COAST REGIONAL CARBON SEQUESTRATION PARTNERSHIP  WINROCK INTERNATIONAL 13

Different carbon pools sequester carbon at different rates. It is not necessary or even desirable to count all pools in a carbon project, though above and below ground live biomass are always counted in a forest carbon project.

Slide 14

Current Land Use Dictates Sequestration Potential

- Sequestration is most attractive where low-value land is readily available and has a high capacity for additional carbon storage (i.e. non-forest land)
- Co-benefits can be wide-ranging and add commercial value to sequestration projects as well as elevate project visibility and improve public perception
- Risks: Environmental factors can lead to lower-than-expected yields for sequestration projects

Slide 15

Offset Project Elements

- Additionality
- Baselines
- Leakage
- Reversibility (Permanence)
 - Duration
 - Risk of Loss
- Measurement and Monitoring

WEST COAST REGIONAL CARBON SEQUESTRATION PARTNERSHIP 

- Additionality refers to the situation where a project results in carbon benefits additional to those that would have taken place in the absence of the carbon project activity.
- The baseline describes what would have happened in the absence of the carbon project, and the resulting emissions that would have occurred.
- Leakage is change in GHG emissions that occur outside a project boundary, but can be attributed to the project activities.
- Reversibility refers to the length of time the project must ensure that carbon stocks are maintained. This is defined differently by different registries.
- Measurement and monitoring are critical to ensuring continued carbon benefits from the project.

Slide 16

Additionality

A project activity is additional if the activity only takes place **because of the anticipation of a potential sale** of carbon credits

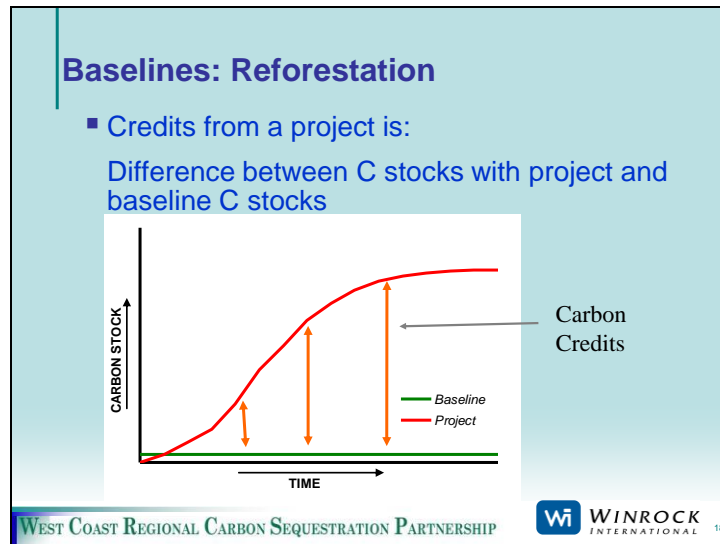

- e.g. An activity such as forest restoration would not have taken place without outside funds paying for the planting, etc. in anticipation of receiving carbon offsets
- e.g. If an enforced law prevents deforestation, credits should not be available for avoiding deforestation

Slide 17

Baselines

- Setting a baseline requires projecting future activities in the absence of a project = What would have happened in the absence of the project activity
- Baseline has two components—land use/cover and corresponding carbon
- Must be prepared in a *transparent* and *conservative* manner

Slide 18

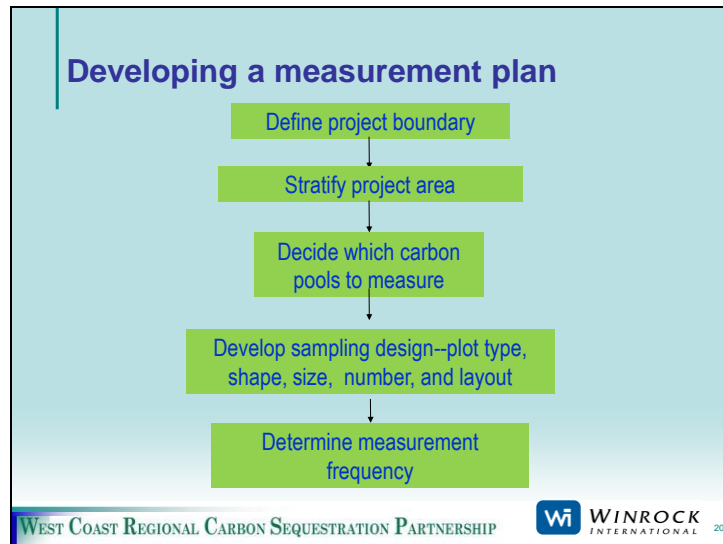

Slide 19

Baselines: Forest Management

- Credits from a project is:
Difference between C stocks with project and
baseline C stocks

Slide 20

Slide 21

Principles of monitoring carbon

- Methods for measuring carbon credits are based on measuring changes in carbon stocks
- Not practical to measure everything - so we sample
- Sample subset of land by taking relevant measurements of selected pool components in plots
- Number of plots measured predetermined to ensure both **accuracy** and **precision**

Slide 22

Ecosystem benefits

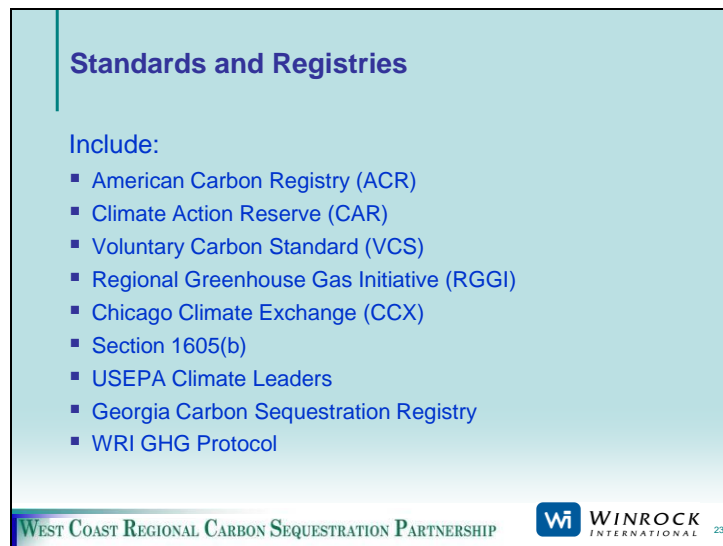

- Forest conservation
- Wildlife habitat
- Water quality
- Timber management

WEST COAST REGIONAL CARBON SEQUESTRATION PARTNERSHIP

Wi WINROCK INTERNATIONAL 22

Most projects have benefits in addition to carbon benefits.

Slide 23

Standards and Registries

Include:

- American Carbon Registry (ACR)
- Climate Action Reserve (CAR)
- Voluntary Carbon Standard (VCS)
- Regional Greenhouse Gas Initiative (RGGI)
- Chicago Climate Exchange (CCX)
- Section 1605(b)
- USEPA Climate Leaders
- Georgia Carbon Sequestration Registry
- WRI GHG Protocol

WEST COAST REGIONAL CARBON SEQUESTRATION PARTNERSHIP  WINROCK INTERNATIONAL 23

Different registries have different requirements and receive different levels of market recognition. More information is presented in the presentation on developing and registering a forest carbon project.

PROJECT EXAMPLES: PILOT REFORESTATION PROJECTS IN SHASTA COUNTY, CA

Slide 1

WEST COAST REGIONAL CARBON SEQUESTRATION PARTNERSHIP
westcarb.org

**Reforestation Pilot Projects
in Shasta County**

W. M. BEATY & ASSOCIATES, INC.

Slide 2

Introduction to WESTCARB Afforestation

Project aims were to:

- Determine feasibility of producing carbon offsets from afforestation of private lands in Shasta County
- To enable maximization of land potential, additional income streams while not foregoing existing streams
 - Plus gives landowners the chance to impact climate change
- Encourage afforestation of rangelands
- Examine costs associated with afforestation
- Examine costs of monitoring plantings for carbon credit

Slide 3

1. Mixed Conifer Forest

- On lands currently dominated by shrubs such as manzanita
- Shrubs preventing return of forest
- Project will involve substantial site preparation: killing and removing shrubs
- High carbon yield expected

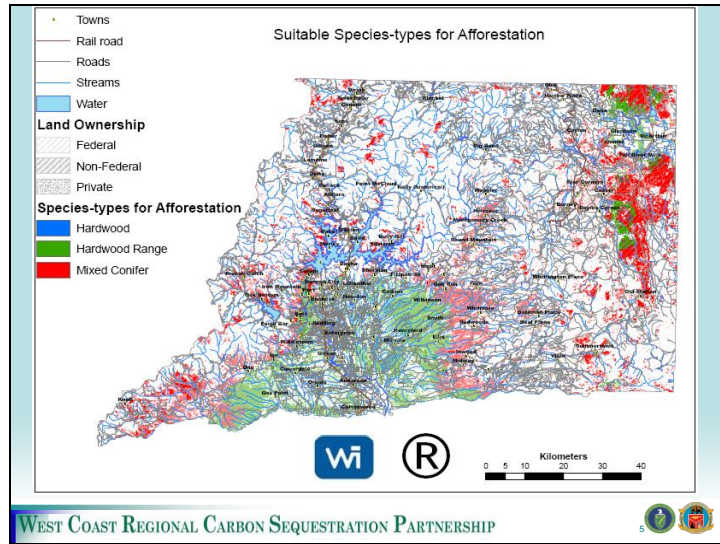

Slide 4

2. Native oak species

- The aim of this form of project was to return to an historic land cover without reducing forage yield
- No opportunity cost as grazing can continue both during establishment and beyond

Slide 5

Slide 6

Office Evaluation of 50 Potential Projects
Criteria for Feasibility & Selection:

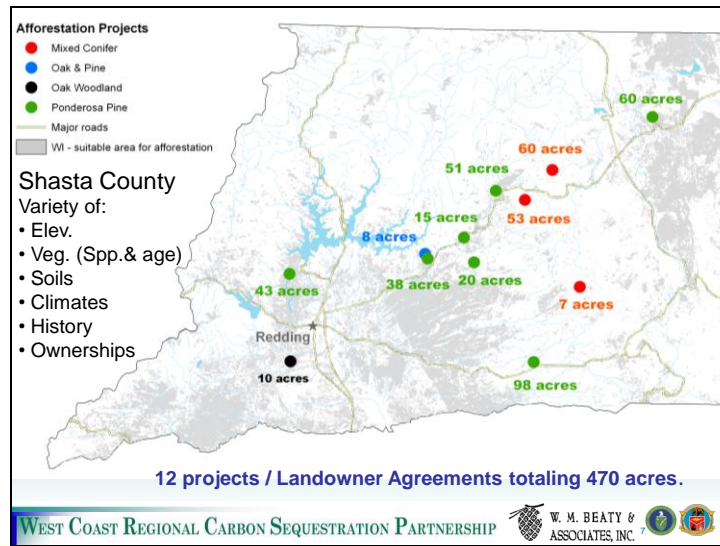

- **CCAR Forestry Protocol eligibility (pre-2009):**
 - < 10% Tree Canopy (used NAIP or GE photos)
 - > 10 yr. out of forest cover
- **Seed Zone & Elevation**
- **NRCS Soil Surveys: Depth & AWC etc.**
- **Slope**
- **Access Roads (for equipment & crews)**
- **Easements & Property Corners/Lines**
- **Landowner's objectives**
- **Regulatory constraints: T&E, 1600 permits etc.**
- **Other Misc.**

.....20 out of 50 selected for Site Visits

WEST COAST REGIONAL CARBON SEQUESTRATION PARTNERSHIP 

Did not choose projects that needed surveying, 1600 or T&E permits etc since time was already very limited to get projects agreed to and finished within grant time period.

Slide 7

Slide 8

Shasta Afforestation Projects	
98 ac	Ponderosa pine afforestation, <i>brush removal for bioenergy</i>

60 ac	Ponderosa pine afforestation, recent fire (2007)
7 ac	Oak woodlands

WEST COAST REGIONAL CARBON SEQUESTRATION PARTNERSHIP 

Total of 470 planted acres.

Slide 9

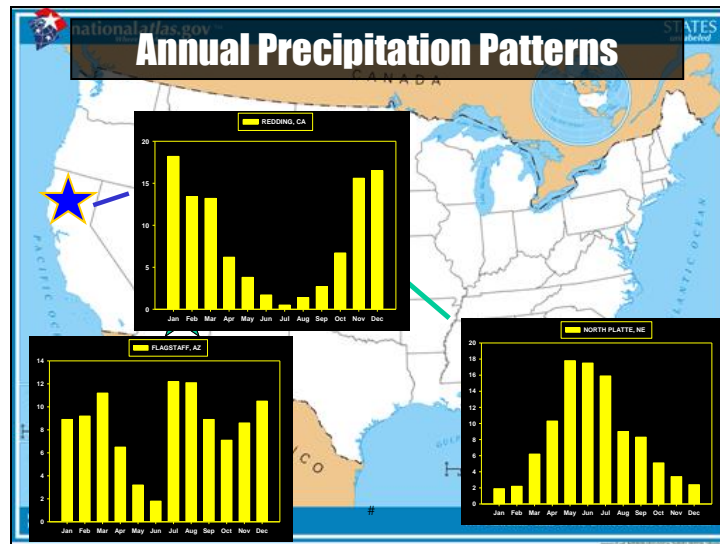

Mediterranean Climate

- Cool/wet Winters
 - Competing vegetation/fuel
- Warm/dry Summer
 - Annual fire season
 - Soil moisture is limiting factor for conifer seedling survival
- Lightning

Mediterranean Climate: basic pattern is not expected to change. May be enhanced.

Slide 10

Charts compare the California Mediterranean climate (e.g., Redding) to typical climates from other parts of the continental USA. Emphasizes why our climate promotes frequent fires – least precipitation during the hottest months.

Slide 11

Seed for 2,200' to 5,000' ponderosa pine plantings came from CAL FIRE's share of the North Sierra Tree Improvement Association's Malin Seed Orchard. Other seed was provided by Beaty & SPI from their seed banks.

Slide 12

Slide 13

Slide 14

Slide 16

Seedlings must be kept in cold storage from lifting/packing until they are planted in the field

Slide 17

Decadent manzanita brushfield on lands denuded of conifers by early 1900's copper smelting fumes. Foreground was masticated.

Mastication is preferred site preparation method on this very low elevation (800') and hot, dry site that was subjected to erosion after the early 1900's smelter caused conifer die off. Since the whiteleaf manzanita species does not re-sprout, clearing the brush and root system with a cat was not needed. The masticated material provides an excellent "mulch" to protect the soil from erosion and reduce evaporation to provide more soil moisture for conifer seedling establishment.

However numerous manzanita seeds germinated after the mechanical mastication. These manzanita seedlings need to be treated prior to planting conifers.

Slide 18

Numerous manzanita seeds germinated after the mechanical mastication. These manzanita seedlings need to be treated prior to planting conifers. The dead brush in this picture was treated with a chemical site preparation spray in the spring of 2008. Control of brush that would otherwise soon re-occupy the site is critical on this low elevation, hot, dry site. The young conifer seedlings scheduled for planting in 2009 will need all of the available soil moisture they can get.

Slide 19

1/3 of project area burned 8 months prior to planting

2008 Motion Fire

Project Area

How would soil & seedlings respond to loss of "mulch" on shallow soils at very low elevation w/ very high summer temps?

WEST COAST REGIONAL CARBON SEQUESTRATION PARTNERSHIP

19

A portion of the Frase Project area was burned by the "Motion Fire" in the Northern California Fire Siege of 2008. This wildfire occurred prior to planting on the project area.

Slide 20

Planted: Feb 2009; picture: Sept 11, 2009
No rain from mid June through mid Sept 2009

Slide 21

A portion of the Frase Project area was burned (prior to planting) by the “Motion Fire” in the Northern California Fire Siege of 2008, yet seedlings still survived well on the burned areas.

Slide 22

Masticated unburned area > 95% Survival

Slide 38

Slide 39

1992 Fountain Fire: 65,000 acres

- Timber companies replanted within 5 years after fire: now ~ 20 ft. tall conifers & some re-sprouted oaks
- Most "small" non-industrial landowners did not replant: now brush and re-sprouted oaks

WEST COAST REGIONAL CARBON SEQUESTRATION PARTNERSHIP  39

Slide 40

40

Slide 41

Slide 42

Slide 43

- Afforestation costs for this site will be much less if planted in the next few years before the brush re-sprouts and/or germinate seedlings become well established.
- Also there will be much less disturbance since no mechanical site preparation will be needed if afforestation is done in a timely manner after the wildfire.

Slide 44

- One year-old Styro 5 containerized ponderosa pine seedlings were test planted on March 20, 2008 at three different elevations on this old brushfield site which burned in 1982 and again in 2007. NRCS describes the soils as capable of growing commercial conifers (ponderosa pine) on this site with average annual PPT of 20".
- Afforestation costs for this site will be much less if planted in the next few years before the brush re-sprouts and/or germinate seedlings become well established.
- Also there will be much less disturbance since no mechanical site preparation will be needed if afforestation is done in a timely manner after the wildfire.

Slide 46

Power Fire project

Slide 47

Power fire project

- Although this is a very dry site that has been occupied by brush for many decades, the excellent survival of our test planted ponderosa pine seedlings confirms the NRCS soils descriptions that the site is capable of growing commercial conifers. The planted seedlings were “tested” in an exceptionally dry year with only 24% of the normal spring precipitation falling followed by a long, dry, hot summer.
- Competing weed seedlings were treated in March on the test areas, but the re-sprouting brush was not. To prepare the site for operational planting in 2010 the resprouting brush was treated in September of 2008 on the entire 60 acre project area.
- Afforestation costs for this site will be much less if planted in the next few years before the brush re-sprouts and/or germinate seedlings become well established.
- Also there will be much less disturbance since no mechanical site preparation will be needed if afforestation is done in a timely manner after the wildfire.

Blue Oak 2009 Planting

Good Survival: ~ 86% spots
w/ at least one oak seedling

WEST COAST REGIONAL CARBON SEQUESTRATION PARTNERSHIP

E Project: oak & pine planting

Slide 53

SOME LESSONS LEARNED (OR RE-CONFIRMED)

- Must have a **good plan** & the **commitment** of all “partners” to follow through with the timely implementation of each sequential step over a multi-year project.
- **Quality control** and **oversight** at each step is critical to success.
- Need **good seed** that is adapted to the site. **Access to a well supplied and diverse seed bank is important.**
- Need good **quality nursery stock** and **quality control** during storage, handling and planting of seedlings.
- **Control of competing vegetation is critical to success.**
- **Cannot rely on “normal” rainfall patterns.**
- Non-industrial ownerships: higher costs/acre for many reasons. Many willing to pay 25% for conifers but not oaks

Slide 54

SOME LESSONS LEARNED (OR RE-CONFIRMED)

- Reforestation Project = Long term fuel management project
- Timely reforestation after wildfire:
 - Reduces costs
 - Reduces impacts to soils and environment
 - Increases the available acres (e.g. steep & rocky sites)
 - Faster net carbon gained in most accounting protocols
- Opportunities for artificial regen. of blue & live oaks (on non-conifer sites), but not needed for black oak (conifer sites).
- Mastication is viable alternative to clearing on sites w/ erodible soils and/or non-sprouting brush species
- Ponderosa pine success is good over wide range & variability in PPT and site conditions (w/ weed control!).
- Active management is needed to increase (or even maintain) acres of conifer forests in interior California

Slide 55

15 YEAR-OLD PLANTATION
Established after wildfire in Northeastern California

Both areas were planted after the same wildfire but:

NO WEED CONTROL	WEED CONTROL
	

For the first 10 to 15 years both sites have equal amounts of total carbon, so there is a long wait to re-coup investment even though long term carbon/climate benefits are huge: Brush/burn/brush etc. cycle vs. Fire resilient forest w/ large trees

WEST COAST REGIONAL CARBON SEQUESTRATION PARTNERSHIP

55

General Growth Projections

Year	tons CO ₂ /ac				
	Pine	Fir	Pine/Fir	Pine/Oak	Oak
	300 tpa	300 tpa	200/85 tpa	100/50 tpa	100 tpa
0	18	18	18	18	18
10	19	17	18	18	18
20	61	29	50	32	18
30	136	79	121	66	19
40	203	159	191	108	20
50	259	256	255	155	22
60	305	353	308	202	23
70	336	441	346	246	25
80	361	514	374	287	28
90	379	571	393	322	31
100	394	618	412	351	34

WEST COAST REGIONAL CARBON SEQUESTRATION PARTNERSHIP 

Baseline tons must be subtracted from growth projections to determine offsets produced.

Slide 63

Pine: 300 tpa planted

Fir: 300 tpa

Pine/fir: 200 pine/ac, 85 fir/ac

Pine/oak: 100 pine/ac, 50 oak

Oak: 100 oak/ac planted

Slide 64

Tons of CO₂/ac on project example, Ponderosa pine planted, 300 trees per acre.

Slide 65

Costs for Carbon Management Projects

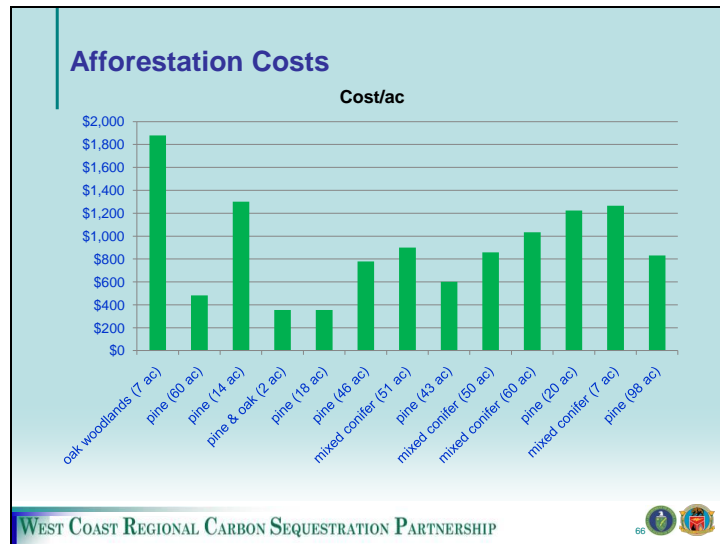

- Establishment costs
 - Site preparation
 - Buying and planting seedlings
 - Easements
 - Validation
- Maintenance costs
- Measurement costs
 - Registry
 - Variability
 - Project area
- Opportunity costs
- Carbon alone rarely covers all costs

WEST COAST REGIONAL CARBON SEQUESTRATION PARTNERSHIP

65

Slide 66

Costs of forestry work, do not include costs of project design/management plan or carbon measurement and monitoring

Costs vary based on site preparation requirements, ease of access to the site, cost of disposal of removed shrubs, and weed/competition control required after planting.

Slide 67

Some examples

Slide 68

Sivadas

Slide 69

Lakey, 2007 Power wildfire, reburned a portion of 1982 Chalk fire

Slide 70

Overview of Forest Carbon Project

- Determine most likely “without project” activities
- Identify baseline condition for “without project” scenario
 - Forest inventory
 - Analysis to determine carbon stocks
- Site preparation
 - A loss in carbon will occur with the removal of shrubs and grasses
- Replant with mixed conifer species
- Determine projected growth and resulting “with project” carbon stocks
- Site maintenance
- Re-inventory approximately every 5 years

WEST COAST REGIONAL CARBON SEQUESTRATION PARTNERSHIP  71

DEVELOPING AND REGISTERING A FOREST CARBON PROJECT IN NORTHERN CALIFORNIA

Slide 1

Slide 2

Outline

1. What is an offset?
 - Offset quality criteria
 - What does an offset “registry” do?
2. Developing and registering a forest carbon project
 - Focus on ACR and CAR
3. Legislative and market update

- Westcarb has shown afforestation can be done on small landholdings, practices and costs well understood, carbon measurement and monitoring in place; but how can this be replicated and scaled up by linking landowners to C markets, including through aggregation where needed?
- What assistance is available? What does it cost? What does it require of landowners?
- How can it help California achieve its GHG reduction goals, and provide income to landowners, and improve land management?
- These questions are largely independent of different views whether cap-and-trade is a good idea.

Slide 3

What is an offset?

- Greenhouse gas emission reduction or removal used to compensate for emissions that occur elsewhere
- Project-based GHG reductions occurring in unregulated sectors, used by regulated entity for compliance
- Measured change vs. a baseline scenario
- Specific project type and vintage

Slide 4

Voluntary and pre-compliance offsets

Voluntary	Pre-compliance
<ul style="list-style-type: none">– Value based on perceived quality– Buyers want “the story” behind the project– Marketing or reputational benefit– Regulatory approval not necessary– May not be verified, registered or retired– Variable quality	<ul style="list-style-type: none">– Value based on compliance recognition– Registered in approved early action program– Meet rigorous set of standards– Independently verified– Players want to gain experience, hedge against future requirements, help shape regulations

Slide 5

What is cap-and-trade?

Market-based mechanism to efficiently reduce emissions

- Government sets declining cap on emissions
- Program administrator (EPA, CARB) creates allowances and distributes via allocation or auction
- Each year capped entities must hold allowances = prior year emissions
- Compliance:
 - Reduce GHG emissions at covered facilities
 - Purchase allowances from other regulated entities
 - Purchase allowances from Government at auction
 - Purchase offsets

A cap-and-trade system sets an overall limit on emissions, requires entities subject to the system to hold sufficient allowances to cover their emissions, and provides broad flexibility in the means of compliance. Entities can comply by undertaking emission reduction projects at their covered facilities and/or by purchasing emission allowances (or credits) from the government or from other entities that have generated emission reductions in excess of their compliance obligations.

Slide 6

Source:

RGGI, MGGRA, and WCI white paper. *Ensuring Offset Quality: Design and Implementation Criteria for a High-Quality Offset Program*. May 2010.

Slide 7

Offset quality criteria

Additional	Reductions are beyond regulations, beyond common practice, beyond business-as-usual
Real	After-the-fact, measurable GHG reductions
Permanent	Atmospheric benefit is permanent, or reversal risk is assessed and mitigated to make non-permanent offsets fungible with other offsets, on-system reductions and allowances
Net of leakage	Emission increases outside project boundary, due to project, are mitigated
Verified	Reductions are verified by an approved, accredited third party Rules complied with and GHG assertion is without material discrepancy
Serialized	Transparent accounting and tracking ensures same reduction used only once

Slide 8

What does a registry do?

- Publish/approve standards, methodologies, tools
 - Public consultation and scientific peer review (ACR)
 - Stakeholder work groups (CAR)
- Act as gatekeeper on quality
 - Set standards and certify they have been met
 - Sellers know what is required, buyers have confidence offset is real/has compliance value, public has confidence in results
- Provide transparent serialized tracking of issuances, transactions, retirements
- Make project documentation publicly accessible
- Oversee third-party verification

And not do:

- Develop projects
- Own or transact offsets
- Broker or serve as intermediary in transactions
- Set prices
- Create derivatives, futures, options, etc.
- Verify projects

Slide 9

American Carbon Registry

- First U.S. private voluntary GHG registry
 - Founded 1997 by Environmental Defense Fund and Environmental Resources Trust
 - 30 million tons issued
- Pioneered system of transparent on-line reporting and serialization of verified project-based offsets – now the industry standard
- Joined Winrock International in 2007
 - Founded 1984 as a “public benefit corporation” under Arkansas state law

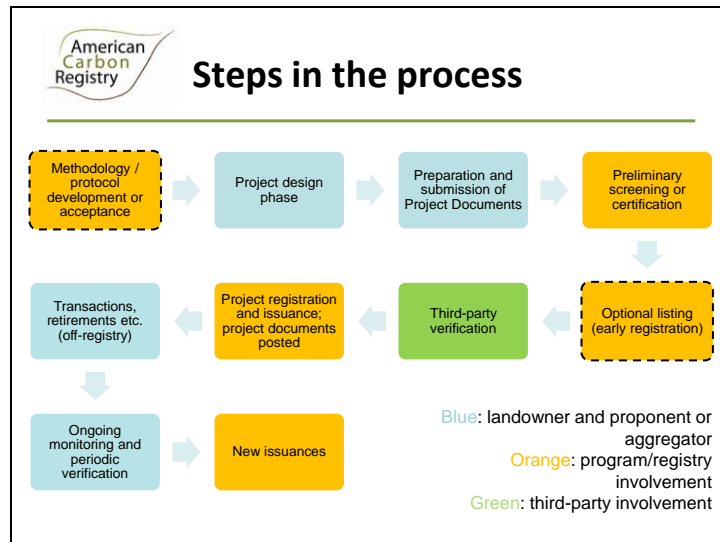

Slide 10

What does developing a forest carbon project mean to you?

- Steps in the process
- Key players and their roles
- Basics of ACR and CAR forest carbon protocols
- Eligible activities
- Additionality
- Permanence and risk mitigation
- Aggregation

Slide 11

Third-party validation also required by some programs. May happen before submission of project documents, or at same time as verification. Not required by ACR or CAR.

Slide 12

Parties involved

Party	Basic roles
Landowner	<ul style="list-style-type: none"> •Title to lands; offset title until transferred to proponent or buyer •May be required to sign long-term agreement •May have monitoring, verification, risk mitigation obligation
Proponent	<ul style="list-style-type: none"> •Project design, interface with registry •Take offset title, incur costs, market offsets... many models •May have monitoring, verification, risk mitigation obligation
Aggregator	<ul style="list-style-type: none"> •Aggregate landowners to spread transaction costs and diversify risk •Educational and organizational role
RPF	<ul style="list-style-type: none"> •Project design assistance
Offset program or registry	<ul style="list-style-type: none"> •Publish/approve protocols •Gatekeeper on quality •Transparent serialized tracking •Oversee verification
Verifier	<ul style="list-style-type: none"> •Third-party auditing against requirements of program •Opinion on whether GHG assertion is without material discrepancy
Offset buyer	<ul style="list-style-type: none"> •Entity purchasing and using offsets for voluntary, pre-compliance, or speculative purposes

Slide 13

Basics: ACR and CAR

	ACR	CAR
Scope	Worldwide	United States Mexico, Canada in future
Land ownerships	Private, all public, Tribal	Private and public (non-federal) for reforestation and IFM; private for avoided conversion
Eligible activities	<ul style="list-style-type: none"> •Afforestation/Reforestation •Improved Forest Management •Reducing Emissions from Deforestation (Avoided Conversion) 	<ul style="list-style-type: none"> •Reforestation •Improved Forest Management •Avoided Conversion •Urban Forestry
Minimum term	40 years from start date	100 years after last credits issued
Risk mitigation	Buffer contribution (any ERTs) Insurance and other financial options	Buffer reserve

Slide 14

Basics: ACR and CAR

	ACR	CAR
Agreement with	Proponent	Landowner
Additionality	"Three-prong test" or performance standard	Performance standard approach Automatic for reforestation Based on baseline stocks for IFM
Crediting period (baseline validity)	20 years for A/R and most IFM	100 years
Other requirements		Sustainable harvesting, "natural forest management," age classes, max. 40-acre clearcuts...
Verification	By independent third-party verifiers accredited by ANSI for relevant sectoral scope	

Slide 15

Afforestation/Reforestation

- Establishing, increasing and restoring vegetative cover through the planting, sowing or human-assisted natural regeneration of woody vegetation
- Targets eventual establishment of forest
- Carried out on marginal agricultural or rangelands, brush fields, buffer areas, windbreaks, etc.
- Not cleared of forest in last 10 years solely to implement A/R project
 - Exceptions for fire, natural disturbance, brush removal for site preparation

Forest (for projects in U.S.; based on U.S. Forest Service Forest Inventory & Analysis Program definition)

Land with at least 10 percent cover (or equivalent stocking) by live trees of any size, including land that formerly had such tree cover and that will be naturally or artificially regenerated. To qualify, the area must be at least 1 acre in size. Forest land includes transition zones, such as areas between forest and non-forest lands that have at least 10% cover (or equivalent stocking) with live trees and forest areas adjacent to urban and built-up lands.

Not excluded: urban forests, forests <120 feet wide as long as >1 acre.

Slide 16

Improved Forest Management

- Activities to reduce GHG emissions and/or enhance GHG removals, implemented on lands designated, sanctioned or approved for forest management
 - Extending rotation lengths in managed forest
 - Increasing forest productivity by thinning diseased or suppressed trees
 - Managing competing brush and short-lived forest species
 - Increasing buffers or other set-asides
 - Increasing the stocking of trees on understocked areas
 - Increasing carbon stocks in harvested wood products
 - Improving harvest or production efficiency
 - Shifting from shorter- to longer-term wood products

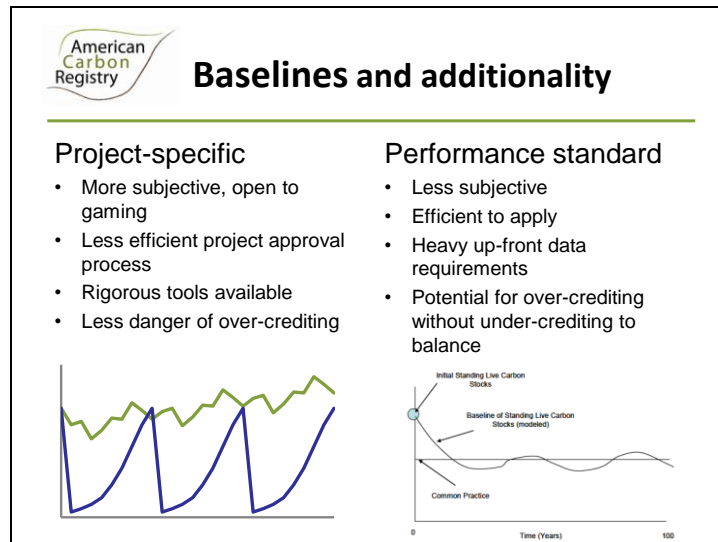

Slide 17

Additionality

- GHG reductions and removals exceed those that would have occurred under current forestry laws and regulations, current forest industry practices, and under a business-as-usual scenario
 - Regulatory surplus and exceeds performance standard
 - Three-prong test:
 - Regulatory surplus
 - Exceeds common practice for area, forest type, similar landowners
 - Faces at least one implementation barrier: financial, technological, institutional

Slide 18

Slide 19

Permanence and risk mitigation (ACR)

- **Minimum Project Term of 40 years**
 - Ensure project activity maintained, monitored and verified over relevant timeframe
 - Balance time commitment with broad landowner participation
 - Required of Project Proponent only
- Risk assessment and mitigation makes forest offsets effectively permanent and fungible with other offsets, allowances and emission reductions
- Focus on mitigating reversals so atmosphere “made whole”

No scientific basis or international standard for a given number of years

Minimum term is about striking a balance:

Commitment is credible

Timeframe meaningful in terms of climate change mitigation

Market participation is broad

Avoid limiting participation; provide flexibility mechanisms

Risk is manageable for proponent and landowner

Treat like insurance

Offsets are fungible

No temporary credits, term credits, discounting

No assigning liability to buyer/compliance entity

Atmosphere always “made whole”

Slide 20

Risk mitigation options (ACR)

- Project-specific risk assessment
- Buffer contribution
 - From project itself
 - ERTs of any other type and vintage
- Unintentional reversal:
 - Proponent pays “deductible”; ACR retires buffer tons for remainder; “premium” goes up
- Intentional reversal (“buy-out option”):
 - Proponent replaces all issued ERTs for that portion of project
- Alternate risk mitigation options accepted
 - Insurance or other financial assurances to replace losses

Slide 21

Permanence and risk mitigation (CAR)

- PIA obligation of 100 years after last credits
 - Project monitoring, verification, reversal liability, harvest guidelines and “natural forest management”
 - Required of landowner (and successors, heirs, assigns, and new owners)
 - Superior to all other claims unless additional buffer contribution made
- Buffer CRTs canceled in event of reversals
 - Avoidable vs. unavoidable reversals
 - >1:1 penalty for any avoidable reversal before 50 yrs
- Focus on monitoring carbon stocks on site

But...

- A Forest Project automatically terminates if a Significant Disturbance occurs, leading to an Unavoidable Reversal that reduces the project’s standing live tree carbon stocks below the project’s baseline standing live tree carbon stocks. Once a Forest Project terminates in this manner, the Forest Owner has no further obligations to the Reserve.
- A Forest Project may be voluntarily terminated prior to the end of its minimum time commitment if the Forest Owner retires a quantity of CRTs, as specified under ‘Retiring CRTs Following Project Termination,’ below. (“buy-out” of all issued CRTs, only from project or other forest CRTs)

Slide 22

Aggregation guidance (ACR)

- Key for transaction cost efficiencies (inventory, monitoring, verification) and risk diversification
- Agreement is still with Proponent (here aggregator)
 - Proponent commits to reversal risk mitigation, including exit of participating landowners
- For inventory and monitoring, precision targets applied at overall project level
 - $\pm 10\%$ of the mean at 90% confidence
 - Use stratification; does not require plots on every landholding
- Verification (reasonable assurance; $\pm 5\%$ materiality) also at project level
 - Risk-based approach and not all properties necessarily visited

Slide 23

Aggregation guidelines (CAR)

- “Aggregate” capped at 5,000 acres, 2 or more Forest Owners
- Each Forest Owner still has own PIA, liability for reversals, CAR account, baseline inventory, annual reports, etc.
- Aggregator provides services; *may* act as agent in transactions
- Goals:
 - Fewer plots to achieve 5% at 90% confidence sampling error
 - Only half of properties verified each 6-year interval
- Constraints on leaving aggregate

Slide 24

Legislative and regulatory landscape

- No U.S. federal climate legislation
 - Scaling back from economy-wide cap-and-trade, to power sector cap-and-trade, to RES, to offshore oil etc., to nothing
 - Bills generally friendly to offsets, recognize cost containment and political value... but no bill
- EPA proceeds with regulation under Clean Air Act
 - Endangerment finding, mobile sources, stationary sources
 - Offsets and other market mechanisms unclear

Slide 25

Eligible offset types (Stabenow and Kerry-Lieberman)

- Projects that reduce, flare or use methane:
 - Methane from mines, landfills, natural gas
 - Reduce fugitive emissions in oil & gas sector
 - Manure management, anaerobic digestion, waste aeration
- Projects that reduce CO₂ emissions or increase sequestration in agriculture, livestock, forestry, land use:
 - Afforestation/reforestation, improved forest management, reduced deforestation, urban forestry
 - Agricultural, grassland, and rangeland sequestration and management
 - Avoided conversion of grassland/rangeland/forest
 - Management/restoration of peatlands and wetlands
 - Conservation of marine coastal habitats
 - N₂O emission reduction (fertilizer production and/or use)
 - Biochar production and use
- Recycling and waste minimization
- Carbon Capture & Storage (with or without enhanced oil recovery)
- Destruction of ozone-depleting substances
- Small off-grid renewable electricity
- Projects reducing the GHG intensity of agricultural production

Slide 26

“Qualified Early Offset Programs”

- Established before January 1, 2009
- Offset standards/methodologies/protocols must:
 - Be developed through public consultation or peer review
 - Require offsets be measurable, additional, verifiable, enforceable, permanent
 - Be made available to the public
- Require verification by accredited verifier
- Publicly accessible registry, serialized tons
- Financial assurance requirements
- No program involvement in project development

Roughly same as Stabenow language.

Slide 27

Legislative and regulatory landscape

- Focus shifts (back) to states and regional programs
- California AB32 cap-and-trade rule by end 2010
 - Proposition 23
- WCI released final cap-and-trade design
 - Not all original members participating
- Offsets seen as key
 - No clarity yet on which protocols will be recognized
 - Forestry a safe bet

Slide 28

Source: Bloomberg New Energy Finance / Ecosystem Marketplace. Building Bridges: State of the Voluntary Carbon Markets 2010.

Total transaction volumes: from 127 MMT in 2008 to 93 MMT in 2009

Further declines in 2010

Slide 29

Still... forest carbon remains a relatively safe bet

- Protocols are well established
- Generally cost-effective → offsets at an attractive cost per ton
 - Large potential supply
 - Attractive to both voluntary and pre-compliance buyers
- State and regional programs likely to recognize
 - Key to register on an established program
 - ACR, CAR, possibly VCS, possibly others
- Has become central to federal discussions
- Project development timeframe may be a year, more or less... pays to start now

bobr@wmbeaty.com

Slide 2

W.M. Beaty & Associates, Inc. Climate Action Registry (CAR) Reforestation Projects

- 4 Reforestation Projects totaling 16,470 acres
- sizes: 191 acres to 11,637 acres
- 191 acres reforestation after clearing old brushfield
- 16,279 acres reforestation after wildfire
- Very early stages of registration w/ CAR
- Also exploring other registries e.g. ACR
- Maybe a 5th project for a 2008 wildfire on > 2,100 acres?

#

2

Slide 3

Climate Action Reserve (CAR)
Forest Protocol Version 3.1
www.climateactionreserve.org

- **Conservation Easement not required.**
However, requires a 100 Yr PIA
- **1:1 buy out to terminate Reforestation PIA**
- **Reforestation Project no longer required to be unstocked for 10 years**
- **For Reforestation Projects: verification can be postponed until Climate Reserve Tonnes (CRTs) are registered**

3

Slide 4

Climate Action Reserve (CAR)
Forest Protocol Version 3.1:

- Harvested Wood Products (HWP) now eligible for CRTs
- Natural Forest Mgt. restrictions allows for even age management
- Buffer pool for involuntary CRT reversals
- Only discretionary Reforestation projects qualify for CAR

4

Slide 5

3 CAR Forest Protocol Project Types

Improved Forest Management

Avoided Conversion

Reforestation:

- CRT start accumulating later (~ 10 years after planting) but increase at much higher rate than IFM over time.
- Much lower baseline than IFM so far greater % of tree biomass is "additional" for CRT credit
- Lower "risks", costs & commitment of forest assets than IFM

5

Slide 6

5.1. Overview of the Project Submittal Process

Projects that result in the issuance of CRTs follow a number of steps that involve project developers or their authorized representatives, verifiers, and the Reserve administrator. Steps or other actions to be taken by a project developer under these Operating Procedures may generally also be taken by an account holder that is authorized to act on behalf of the project developer, as described in the Terms of Use agreement for the Reserve.

The general steps are:

1. The project developer or its authorized representative submits project and pays submittal fee
2. The Reserve reviews and approves the project
3. The project developer selects an approved verification body in the Reserve
4. The verifier submits a Notification of Verification Activities/Conflict of Interest (NOVA/COI) form
5. The Reserve approves the verification body
6. The project developer enters project data and submits the project for verification
7. The verifier completes the verification activities and submits project verification
8. The Reserve reviews and approves the project
9. The project developer pays the CRT issuance fee
10. The project developer transfers or retires CRTs

Slide 7

Revised 08/2010

Forest Project Submittal Form

Instructions: Please complete all fields as thoroughly as possible. If the project is located in all or in the planning development phase, all fields must be completed using best available data and estimates based on the planning system maps. This is an interactive form file. **Don't clickfields**, please use the form as a PDF prior to uploading it to the Reserve. This will lock your answers and protect the documents from any further changes. **Do** fields that to complete, even if the answer is also provided elsewhere, if a field is not applicable, insert 'N/A' in the space provided. Please note this project submittal form is only for projects submitted under Forest Project Protocol, Version 3.0.

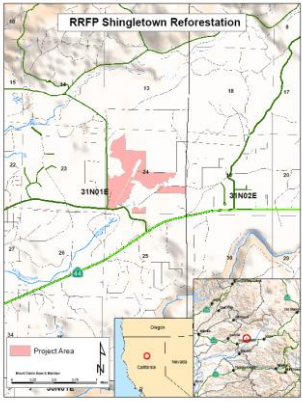

Section 1: Project Contact Information

Project Name: Shingletown Reforestation
 Forest Owner (name of business entity as corporation, partnership, or individual): Red River Forest Partnership
 Forest Owner Contact: Robert Rymerman, W.M. Beatty & Associates, Inc.
 Technical Consultant (name of business entity as corporation, partnership, or individual): n/a
 Technical Consultant Contact: n/a
 Other Parties with a Material Interest: n/a
 Date of Form Completion: 03/15/10 (revised on 4/12/10 to address CAR staff comments)
 Form Completed By (name, organization): Robert Rymerman, RFP # 1921, W. M. Beatty & Associates, Inc.

Section 2: Ownership and Organization Summary

1. List the fee title owners of the land

Names on Fee Title Record	% of Timber Ownership	Management Rule
Red River Forest Partnership (a California General Partnership)	100%	All Management Decision-making
* If ownership is 100%, list other owners and their respective ownership (%).

2008 Planting - Climatic Conditions During 1st Year of Seedling Establishment (>95% survival)

Project	Elev.	Date Planted	Precip. Sept-June		Precip. March-June		% of Normal
			Normal	2007/08	Normal	2008	
RRFP	3,880	April 1	47.63"	30.60"	15.07"	2.91"	19.3%

PPT Data from: PRISM Group, Oregon State University, <http://www.prismclimate.org>, created 23 Sep 2008

WEST COAST REGIONAL CARBON SEQUESTRATION PARTNERSHIP 

Even though we had one of the driest Springs on record (about 20% of normal) and PPT during the March – June period is critical for planted seedlings before the hot dry summer months we had great success!!!!

Slide 17

Ponderosa pine seedling at the end of a long, dry summer
five months after planting on soils w/ low AWC

WEST COAST REGIONAL CARBON SEQUESTRATION PARTNERSHIP

17

Slide 18

2½ years after planting. At this stage there is less carbon than brushfield, but will result in significantly more long term, stable carbon storage

W. M. BEATY &
ASSOCIATES, INC.

Slide 19

15 YEAR-OLD PLANTATION
Established after wildfire in Northeastern California

Both areas were planted after the same wildfire but:

NO WEED CONTROL	WEED CONTROL
	

For the first 10 to 15 years both sites have equal amounts of total carbon, so there is a long wait to re-coup investment even though long term carbon/climate benefits are huge: Brush/burn/brush etc. cycle vs. Fire resilient forest w/ large trees

Slide 20

Very Rough Estimates based on modeling, CRTs sold on actual

Shasta Co. Project 191 Acres

Planted 2008-09 Period	Est. standing @ end of 5 yr period:			Assume buffer*** %	Estimated net CRTs/ac	(avg. for preceding 5 yr period) Annual Net CRT/ac/yr	(avg. for preceding 5 yr period) Annual Total net CRTs/yr
	tree+roots tCO2m/ac	baseline** tCO2m/ac	net tCO2m/ac				
2011	2.8	11	-8.2	25%		0.00	0.00
2012-2016	5.3	11	-5.7	25%		0.00	0
2016-2021	16.3	11	5.3	25%	4.0	2.19	419
2022-2026	30.6	11	19.6	25%	14.7	2.87	548
2027-2031	61.8	11	50.8	25%	38.1	6.23	1,190
2032-2036	94.1	11	83.1	25%	62.3	6.47	1,235
3037-2041	143.7	11	132.7	25%	99.5	9.92	1,894
2042-2046	185.3	11	174.3	25%	130.7	8.31	1,588
2047-2051*	195.0	11	184.0	25%	138.0	1.95	372
2052-2056	208.3	11	197.3	25%	148.0	2.65	507
2057-2061	238.5	11	227.5	25%	170.6	6.04	1,154
2076	320.5	11	309.5				
2106	437.6	11	426.6				

* includes tCO2m from HWP generated from thinnings along with "tree+roots"
 ** baseline based upon Winrock measurements prior to clearing
 *** buffer contribution can range from 18% to 30+%

Slide 26

Cost & Revenue "Guesstimates" through 2036		
Costs: For 191 acre project in Shasta County		
Establishment 2007-2010:	\$109,000	\$570/ac
Follow up release 2010 & 2011:	\$ 19,000	\$100/ac
Misc. plantation maint.:	\$ 20,000	\$105/ac
Subtotal	\$148,000	\$775/ac
Inventories/annual reporting:	\$ 26,000	\$136/ac
CAR submittal & annual fees:	\$ 14,000	\$ 71/ac
CAR Variance fee:	\$ 1,500	\$ 8/ac
Initial partial Verification:	\$ 16,000	\$ 84/ac
4 Verifications @ 6 yr. intervals:	\$ 80,000	\$419/ac
Subtotal	\$137,000	\$712/ac
TOTAL	\$285,000	\$1,492/ac
Cumulative Project Revenue through 2036:		
@ \$6.50/CRT = \$110,00	\$575/ac	
@ \$15.00/CRT = \$254,350	\$1,331/ac	
@ \$25.00/CRT = \$423,900	\$2,220/ac

Project Size:	191 ac	11,637 ac
Planting yrs:	2008-09	2009-11
TOTAL COSTS	\$ 1,492/ac	\$ 410/ac
Est. Revenue:		
@ \$6.50 / CRT	\$400/ac	\$575/ac
@ \$15.00/ CRT	\$1,331/ac	\$932/ac
@ \$25.00/CRT	\$2,220/ac	\$1,540/ac

30

Slide 31

CONCLUSIONS

- Reforesting brush-fields and/or wildfire damaged areas provide significant long term carbon sequestration benefits
- Financial attractiveness for landowners is limited by:
 - High upfront reforestation costs
 - Revenue stream starts much later (10 to 30 years into the future)
 - High uncertainty in future market value of CRTs
 - Uncertainties in CAR protocol interpretation & verification costs
 - Very long term PIA (> 100 years)

Slide 32

Obstacles for small landowner CAR Reforestation Project

- No annual income from timber to support Project development costs which cannot be recouped for a decade or two for revenue from CRTs
- Higher per acre fixed costs for reforestation activities
- Very high per acre fixed costs for CAR registration & verification
- Uncertainties in CAR protocol interpretation & verification
- Obligations of PIA very cumbersome
- Limited availability to a seed bank, reforestation expertise etc.
- CAR's "one size fits all" species diversity requirements disqualify most projects or require an expensive "variance"
- Uncertainty in market value when CRTs accrue (10 to 30 years into future)
