C.N.R.S. II 91405, Orsay, France

The berkelium spectrum, excited in an electrodeless lamp, has been recorded between 3,700 and 12,000  $\text{cm}^{-1}$  on a high resolution Fourier Transform spectrometer. The spectrometer is located at Laboratoire Aimé Cotton. Approximately 200 micrograms of  $^{249}\text{Bk}$  as the triiodide were sealed under vacuum in a quartz tube of 3 mm inside diameter and 25 mm length.<sup>1</sup> The lamp was operated in a cavity at 2,450 MHz with about 80 watts of input power.

Two experiments were run with different spectrometer settings to have the best coverage of the region. One region covered 3,700 to 8,960  $\text{cm}^{-1}$ , and the second was between 8,960 and 12,000  $\text{cm}^{-1}$ . The region higher than 12,000  $\text{cm}^{-1}$  was recorded but it is not as intense as the spectrum recorded on photographic plates. In the 3700-9000  $\text{cm}^{-1}$  region, 900,000 data points were recorded in a run lasting 13 hr 15 min. For the second region 500,300 data points were taken in 7 hr 22 min. The spectrometer was operated in air at atmospheric pressure and the values have been corrected to vacuum. The same electrodeless lamp was

used throughout this investigation.

A computer program performed the Fourier transform and selected the peaks. It printed out a listing of the peak values and their intensities. A paper chart recorded of the spectrum was plotted. It is necessary to check the listing against the plot since some features of the background get recorded as peaks. The intensity has been estimated from the chart recording. The intensity is on a 0-9 scale. Shifts between the two runs are between  $0.004$  and  $0.008 \text{ cm}^{-1}$ , the second run giving the higher wavenumber values.

The complete line list is in Table I. The first column is the vacuum wavenumber in units of  $\text{cm}^{-1}$ . The second column is the line width information. An E in front of the width indicates an estimate of the width, a C indicates the presence of off-diagonal or weak components, and a D indicates a complex pattern, probably a low J or a multiple line pattern. A \* is where no degradation was observed in the hyperfine structure. The units are  $10^{-3} \text{ cm}^{-1}$ . Column three is the estimated intensity on a scale of 0-9. Column four is a code for the character of the line. A 1 is for a sharp line, a 3 for a blended line, and a 4 is for a wide line. A 5 indicates the hyperfine structure is degraded to higher wavenumbers and a 6 is a pattern degraded to lower wavenumbers. A 7 is for a peculiar pattern that is not covered by the other codes. In column 5 is the J value of the odd level and column 6 is J of the even level. Column 7 is the energy value for the odd level and column 8 is the energy value of the even level.

The ground state of Bk I is  $^6H_{15/2}$  of the  $5f^97s^2$  configuration. The Bk II ground state is  $^7H_8$  of the  $5f^97s$  configuration.<sup>2</sup> All entries in Table I with J values of half integers are Bk I lines and whole integer values are Bk II. Of special note is the line  $6530.720\text{ cm}^{-1}$ . This is a transition within the same configuration. The transition is between the ground state  $^6H_{15/2}$  and  $^6H_{13/2}$ , both belonging to the configuration  $5f^97s^2$ . Similar parity forbidden transitions have been observed in Cm and Cf.<sup>4,5</sup>

The odd energy levels of BK I are listed in Table II and the even levels of Bk I in Table III. In the first column of these two tables is listed the value of the level in  $\text{cm}^{-1}$ , in column 2 is the J value, column 3 is the width in units of  $10^{-3}\text{ cm}^{-1}$ . Column 4 is the A value and column 5 is the B value derived from the hyperfine structure. Column 6 is the configuration and column 7 is the term designation. The values of the levels for Bk II are from Worden and Conway.<sup>3</sup>

Berkelium-249 decays with a 318 day half life so that a combination of incomplete chemical separation and a half life short enough to grow in some daughter element between separation and experimental result in the occurrence of many  $^{249}\text{Cf}$  lines and a few  $^{245}\text{Cm}$  lines from the  $\alpha$  decay of  $^{249}\text{Cf}$  (340 y half life).<sup>4</sup> These have been removed from the list. The curium had to take into account the isotope shift. The available data are from the 244 and 246 isotopes of curium. The californium is to be published.<sup>5</sup>

#### ACKNOWLEDGEMENTS

We wish to acknowledge the help of Tom Parsons with the chemical separation of the berkelium, and Mrs. J. Chevillard with the running of the programs, and George V. Shalimoff with the preparation of the table.

One of us (J.G.C.) wish to thank Professor P. Jacquinot and the Centre National de le Recherche Scientifique who made possible the portion of the work at Laboratoire Aimé Cotton.

This work was done under the auspices of the U. S. Energy Research and Development Administration.
