## Abstract

We report the updated classification of Inborn Errors of Immunity/Primary Immunodeficiencies, compiled by the International Union of Immunological Societies Expert Committee. This report documents the key clinical and laboratory features of 430 inborn errors of immunity, including 64 gene defects that have either been discovered in the past 2 years since the previous update (published January 2018) or were characterized earlier but have since been confirmed or expanded upon in subsequent studies. The application of next-generation sequencing continues to expedite the rapid identification of novel gene defects, rare or common; broaden the immunological and clinical phenotypes of conditions arising from known gene defects and even known variants; and implement gene-specific therapies. These advances are contributing to greater understanding of the molecular, cellular, and immunological mechanisms of disease, thereby enhancing immunological knowledge while improving the management of patients and their families. This report serves as a valuable resource for the molecular diagnosis of individuals with heritable immunological disorders and also for the scientific dissection of cellular and molecular mechanisms underlying inborn errors of immunity and related human diseases.

**Keywords** IUIS · primary immune deficiency · inborn errors of immunity · immune dysregulation · autoinflammatory disorders · next-generation sequencing

Inborn errors of immunity, also referred to as primary immunodeficiencies, manifest as increased susceptibility to infectious diseases, autoimmunity, autoinflammatory diseases, allergy, and/or malignancy. These conditions are caused by monogenic germline mutations that result in loss of expression, loss-of-function (LOF; amorphic/hypomorphic), or gain-of-function (GOF; hypermorphic) of the encoded protein [1, 2]. Heterozygous lesions may underlie autosomal dominant traits by GOF, haploinsufficiency, or negative dominance. Biallelic lesions typically cause autosomal recessive traits by LOF of the encoded protein (rarely GOF), while X-linked recessive traits arise from LOF of genes on the X chromosome,

either in the hemizygous state in males or in the homozygous state in females. Rare X-linked dominant traits can also arise from LOF or GOF variants. This results in aberrant immunity due to the critical roles of these proteins in the development, maintenance and function of cells of the immune system, or cells other than leukocytes that contribute to immunity, during homeostasis and in response to external (e.g., infectious agents or environmental antigens) and internal (e.g., cytokines, self-antigens and cancer cells) stimuli [3–5]. Inborn errors of immunity were traditionally considered to be rare diseases, affecting ~1 in 10,000 to 1 in 50,000 births. However, with ongoing discovery of novel inborn errors of immunity (Fig. 1a) and improved definition of clinical phenotypes [6–8], the collective prevalence of these conditions is more likely to be at least 1/1000–1/5000 [9]. Indeed, more common inborn errors have recently been described [10]. Regardless of their exact incidence and prevalence, inborn errors of immunity represent an unprecedented model to link defined monogenic defects with

clinical phenotypes of immune dysregulation, in a broad sense of the term. As a committee, we are aware that human immunity involves cells other than circulating or tissue leukocytes and that it can be scaled up from the immune system to the whole organism. Inborn errors of immunity have unequivocally revealed non-redundant roles of single genes and their products in immune function [3, 4, 6–8], formed the basis of improved mechanism-based therapies for the immunopathology underlying many diseases [8, 11], established immunological paradigms representing the foundations of basic, clinical and translational immunology [3–5, 9, 12–14], and provided insights into the molecular pathogenesis of more common diseases [9, 15]. Clear examples of these include:

- The initial description by Bruton of X-linked agammaglobulinemia (XLA) and the ability to treat this condition with antibody replacement therapy (the mainstay treatment for antibody deficiency diseases such as CVID) [16]
- The discovery of mutations in *BTK* [12] and the subsequent development of BTK-inhibitors such as ibrutinib for the treatment of B cell malignancies [14]
- Progressive CD4 T cell deficiency explains opportunistic infections secondary to HIV infection [9].

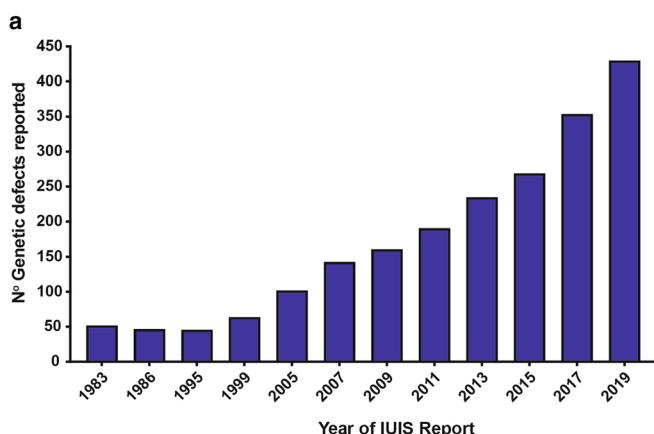

Thus, the study of inborn errors of immunity has provided profound advances in the practice of precision molecular medicine.

Since the early 1950s, when XLA was one of the first primary immune deficiencies to be described [16], clinical immunology has leveraged advances in the development of new methods to expedite the identification of defects of the immune system and the cellular, molecular, and genetic aberrations underlying these conditions. Indeed, the completion of

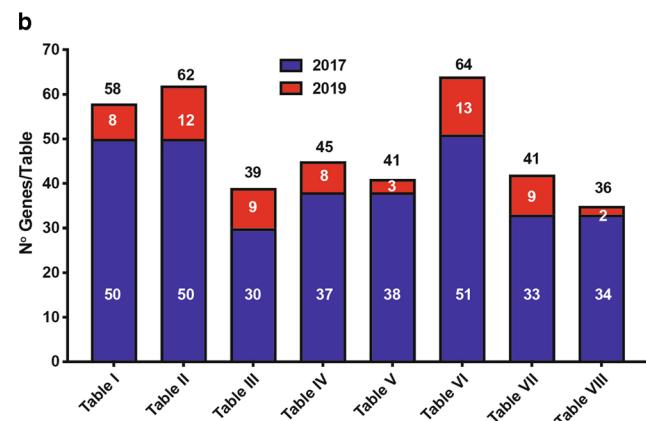

the Human Genome Project in the early 2000s, coupled with rapid developments in next generation DNA sequencing (NGS) technologies, enabled the application of cost-effective and time-efficient sequencing of targeted gene panels, whole exomes, or whole genomes to cohorts of patients suspected of having a monogenic explanation for their disease. These platforms have led to a quantum leap in the identification and diagnosis of previously undefined genetically determined defects of the immune system (Fig. 1a, b; [6–8]).

The International Union of Immunological Societies Expert Committee of Inborn Errors of Immunity comprises pediatric and adult clinical immunologists, clinician/scientists and researchers in basic immunology from across the globe (<https://iuis.org/committees/iei/>). A major objective and responsibility of the committee is to provide the clinical and research communities with an update of genetic causes of immune deficiency and dysregulation. The committee has existed since 1970 and has published an updated report approximately every 2 years to inform the field of these advances (Fig. 1a). In March 2019, the committee met in New York to discuss and debate the inclusion of genetic variants published over the preceding 2 years (since June 2017) [1, 2], as well as gene mutations that had appeared in the literature earlier but, based on newly available evidence, were now substantiated (Fig. 1b).

Rather than simply including every gene variant reported, the committee applies very stringent criteria such that only those genes with convincing evidence of disease pathogenicity are classified as causes of novel inborn errors of immunity [17]. The Committee makes informed judgments for including new genetic causes of immunological conditions based on what we believe is most useful for practitioners caring for patients. Our current, and continuously evolving, practice is that criteria for inclusion can be met by several ways, for

**Fig. 1** Rate of discovery of novel inborn errors of immunity: 1983–2019. **a** The number of genetic defects underlying monogenic immune disorders as reported by the IUIS/WHO committee in the indicated year. **b** The number of pathogenic gene variants listed in each table by the IUIS committee. Report published in 2017, and the number of new genes for each table contained in this report (red bars). The numbers in

each column correspond to the number of genes reported in the 2017 IUIS update (blue bars) [1, 2], the number of new genes for each table contained in this report (red bars), and the total number of genes for each table. Note: only data for Tables 1, 2, 3, 4, 5, 6, 7, and 8 are shown, because Table 9 (bone marrow failure) is a new addition to the current report.

instance peer-reviewed publication of (1) multiple cases from unrelated kindreds, including detailed immunologic data, or (2) very few cases, or even a single case (see below), for whom compelling mechanistic/pathogenic data is also provided, generally from parallel studies in an animal or cell culture model.

Herein, we provide this latest update. The inborn errors of immunity are listed in 10 tables: Combined immunodeficiencies (Table 1), Combined immunodeficiencies with syndromic features (Table 2), Predominantly antibody deficiencies (Table 3), Diseases of immune dysregulation (Table 4), Congenital defects of phagocytes (Table 5), Defects in intrinsic and innate immunity (Table 6), Autoinflammatory diseases (Table 7), Complement deficiencies (Table 8), and Phenocopies of inborn errors of immunity (Table 10) (Fig. 1b). Since the last update (published January 2018) [1, 2], we have added a new table to consolidate genes that cause bone marrow failure (Table 9). Our division into phenotypes does not imply that the presentation is homogeneous. Rather, we recognize that substantial phenotypic and clinical heterogeneity exists within groups of patients with mutations in the same gene and even between individuals from the same pedigree with the identical gene mutation. To simplify the classification, each disorder has been listed only once, although distinct disorders due to mutations in the same gene, but with different modes of inheritance and pathogenic mechanisms are listed individually. Thus, several genes appear more than once in this update (some examples are listed below). Sub-divisions within each table segregate groups of disorders into coherent phenotypic sets. OMIM numbers are also provided within each table. If a OMIM number has not yet been issued for a particular genetic condition, then the number provided generally refers to the OMIM for that gene. Beneath each table, the new disorders added to this update are highlighted for easy reference.

The advances in our understanding of clinical immunology continue to expand at a vast and remarkable rate, with the addition in this update of many—64, distributed across all tables (Fig. 1b)—novel genetic defects underlying inborn errors of immunity. Perhaps not surprisingly, most if not all of these new variants were identified by NGS, thus highlighting that whole exome/whole genome sequencing has become the gold standard for identifying novel pathogenic gene variants [6–8]. Indeed, since the first application of NGS to identify novel inborn errors of immunity was published in 2010 [18], ~ 45% of all currently known disease-causing variants have been discovered by whole exome/genome sequencing. Thus, a typical approach to identifying a pathogenic variant in a new patient might now consist of first sequencing a phenotype-driven panel of genes and advancing to whole exome/genome sequencing if the cause of disease remains elusive.

In this update, we increase the list of immunological diseases to 404, with 430 known genetic defects identified as causing these conditions. The unbiased application of NGS to the discovery and characterization of novel inborn errors of immunity continues to inform clinical and basic immunology. Thus, additional phenotypes have been identified for conditions resulting from variants in known and novel genes; the penetrance of genetic variants on clinical phenotypes has been shown to be highly variable; and clinical entities sharing common phenotypes have been discovered. For example, this update includes the findings that bi-allelic mutations in *ZNF341* [19, 20], *IL6ST* (encoding gp130, a common component of the receptors for IL-6, IL-11, IL-27, LIF, OSM, CNTF) [21, 22], or *IL6R* [23, 24] all cause conditions that resemble autosomal dominant hyper-IgE syndrome due to dominant negative mutations in *STAT3* [15]. Detailed analyses of these patients revealed a novel mechanism of regulating STAT3 signaling (via the transcription factor ZNF341) and defined the exact consequences of impaired IL-6/IL-6R/gp130 and putatively IL-11/IL-11R/gp130 signaling to the phenotype of AD-HIES.

Furthermore, key findings over the past 2 years continue to reveal that distinct mechanisms of disease (GOF, LOF, dominant negative, haploinsufficient), as well as different modes of inheritance (autosomal recessive, autosomal dominant) of variants in the *same* gene can cause disparate clinical conditions. This is a fascinating aspect of the genetics of human disease, and a salient reminder to be cognizant of the nature of the genetic variants identified from NGS. It is these genes that have several entries in this update. A few recent examples include:

1. Heterozygous variants in *CARD11* [25, 26] or *STAT5B* [27] can be pathogenic due to negative dominance. This was potentially unexpected because autosomal recessive LOF variants in both of these genes were previously reported to cause combined immunodeficiency and severe immune dysregulation, respectively, yet heterozygous relatives of these affected individuals were healthy [28, 29].
2. While heterozygous dominant negative mutations in *TCF3*, encoding the transcription factor E47, cause B cell deficiency and agammaglobulinemia [30], nonsense mutations in *TCF3* have now been identified that are pathogenic only in an autosomal recessive state, as heterozygous carriers of these particular allelic variants remained healthy [31, 32].
3. A heterozygous hypermorphic variant in *IKBKB* was found to cause a combined immunodeficiency [33] not too dissimilar to the original description of bi-allelic, recessive variants in *IKBKB* [34]. Similarly, bi-allelic LOF mutations in *PIK3CD* are now known to cause B cell deficiency and agammaglobulinemia [35–37], which is

quite distinct from the immune dysregulated state of individuals with monoallelic activating *PIK3CD* mutations [1, 37]. This observation nicely parallels the earlier findings of either homozygous or heterozygous mutations in *PIK3R1* that clinically phenocopy recessive or activating mutations in *PIK3CD* respectively [1, 37].

4. Distinct diseases can result from heterozygous mutations in *IKZF1* (Ikaros): combined immunodeficiency due to dominant negative alleles [38] or CVID due to haploinsufficiency [39].
5. Similar to *STAT1* [40], variants in *RAC2* [41–45] or *CARD11* [25, 26, 28] can be pathogenic either as monoallelic GOF or LOF or bi-allelic recessive LOF.

Thus, these findings have revealed the fundamental importance of elucidating the impact of a novel variant on the function of the encoded protein and thus the mechanism of pathogenicity. Furthermore, these new entries are an important reminder not to overlook the potential significance of identifying heterozygous variants in genes previously believed to cause disease only in a biallelic manner or to result in a previously defined specific clinical entity. Indeed, there are now at least 35 genes that have multiple entries in the current update, reflecting the distinct mechanisms by which variants result in or cause disease (e.g., *STAT1*, *STAT3*, *NLRP1*, *RAC2*, *ZAP70*, *CARD11*, *IKBKB*, *WAS*, *JAK1*, *IFIH1*, *C3*, *C1R*, *CIS*-GOF or LOF; *STAT5*, *STAT1*, *CARD11*, *ACD*, *CFH*, *CFHR1–5*, *FOXN1*, *RAC2*, *TCF3*, *AICDA*, *PIK3R1*, *IFNGR1*, *TREX1*, *TICAM1*, *IRF8*-AD or AR; *PIK3CD*-AD GOF, AR LOF; *IKZF1*-AD, or haploinsufficient; *NLRP3*—distinct disease phenotypes despite all resulting from GOF alleles).

As noted above, genetic, biochemical, and functional analyses of putative novel pathogenic variants need to meet stringent criteria to be considered for inclusion in this update [17]. These criteria can make reporting genetic findings from single cases challenging, as often the best evidence that a novel variant is disease-causing is to identify additional, similarly affected but unrelated individuals with the same variants, or functionally similar variants in the same gene. While this can be challenging, particularly in light of the rarity of individual inborn errors of immunity, robust mechanistic laboratory investigations continue to provide compelling data from single patients, with or without evidence from animal models. Specifically, homozygous LOF mutations in *IRF9* [46] and *IL18BP* [47] were identified and rigorously characterized in single patients and found to be the molecular cause of life-threatening influenza and fulminant viral hepatitis, respectively.

The study and discovery of novel inborn errors of immunity can also enable improved patient management by

implementing gene-specific targeted therapies. Thus, JAK inhibitors are being used to treat disorders of immune dysregulation resulting from GOF mutations in *JAK1*, *STAT1* or *STAT3* [11], while mTOR inhibitors such as rapamycin or PI3K p110δ-specific inhibitors have been reported for the treatment of individuals with *PIK3CD* GOF or *PIK3R1* LOF mutations [37]. Regarding novel gene defects, immune dysregulation due to *DEF6* deficiency was successfully treated with abatacept (CTLA4-Ig) [48]. This correlated with impaired CTLA4 expression and function in *DEF6*-deficient T cells [48] and parallels the therapeutic use of abatacept and belatacept for LRBA-deficiency and CTLA4 haploinsufficiency, both of which are characterized by reduced CTLA4 expression in affected regulatory T cells [49, 50]. From a theoretical perspective, the finding that MSMD can be caused by mutations in *IL12RB2*, *IL23R* or *SPPL2A* and that these mutations are associated with impaired production of IFNγ—a requisite of anti-mycobacterial immunity—implies that IFNγ administration could be therapeutically beneficial in these clinical settings [51, 52]. Similarly, recombinant IL18BP could potentially ameliorate viral-induced liver toxicity due to *IL18BP* deficiency [47].

The goals of the IUIS Expert Committee on Inborn Errors of Immunity are to increase awareness, facilitate recognition, promote optimal treatment, and support research in the field of disorders of immunity. Thus, this 2019 Update and the accompanying “Phenotypical IUIS Classification” publications are intended as resources for clinicians and researchers. Importantly, these tables underpin the design of panels used for targeted gene sequencing to facilitate genetic diagnoses or inborn errors. In the past 5 years, the number of gene defects underlying inborn errors of immunity has nearly doubled from ~ 250 to 430 (Fig. 1a). The human genome contains 1800–2000 genes that are known to be involved in immune responses [13]. Thus, the discovery and study of inborn errors of immunity has elegantly illustrated that > 20% of these immune genes play non-redundant roles in host defense and immune regulation. With the improved identification and phenotyping of patients with rare diseases, combined with high throughput genome sequencing, the number of genes fundamentally required for immunity will no doubt continue to increase, further revealing critical and novel roles for specific genes, molecules, pathways and cell types in immune responses, as well as mechanisms of disease pathogenesis and targets for immunotherapies. The field of inborn errors of immunity, and the global clinical and research communities, will therefore continue to provide key insights into basic and clinical immunology.

**Table 1** Immunodeficiencies affecting cellular and humoral immunity

| Disease  | Genetic defect             | Inheritance | OMIM             | T cells       | B cells  | Ig  | Associated features  |

| CD3γ deficiency                                      | <i>CD3G</i>  | AR           | 186740   | Normal number, but low TCR expression   | Normal  | Normal  | Immune deficiency and autoimmunity of variable severity   |
| CD8 deficiency                                       | <i>CD8A</i>  | AR           | 186910   | Absent CD8, Normal CD4  | Normal  | Normal  | Recurrent infections, may be asymptomatic   |
| ZAP-70 deficiency (ZAP70 LOF)                        | <i>ZAP70</i>   | AR           | 269840   | Low CD8 number, normal CD4 number but with poor function  | Normal  | Normal  | May have immune dysregulation, autoimmunity   |
| ZAP-70 combined hypomorphic and activating mutations | <i>ZAP70</i>   | AR (LOF/GOF) | 617006   | Decreased CD8, normal or decreased CD4 cells  | Normal or decreased   | Normal IgA, low IgM, low/normal IgG; protective Ab responses to vaccines  | Severe autoimmunity (bullosis pemphigoid, inflammatory colitis)   |
| MHC class I deficiency                               | <i>TAP1</i><br><i>TAP2</i><br><i>TAPBP</i><br><i>B2M</i>                     | AR           | 170260<br>170261<br>601962<br>109700           | Low CD8, normal CD4, absent MHC I on lymphocytes  | Normal  | Normal  | Vasculitis, pyoderma gangrenosum  |
| MHC class II deficiency group A, B, C, D             | <i>CTTA</i><br><i>RFXANK</i><br><i>RFX5</i><br><i>RFXPAP</i><br><i>IKZF1</i> | AR           | 600005<br>603200<br>601863<br>601861<br>603023 | Low CD4+ T cells, reduced MHC II expression on lymphocytes<br>no memory T cells   | Normal  | Low IgG, recurrent sinopulmonary infections, pneumocystis early CID onset | Failure to thrive, respiratory and gastrointestinal infections, liver/biliary tract disease   |
| IKAROS deficiency                                    | <i>DOCK8</i>   | AR           | 243700   | T cell lymphopenia, reduced native CD8 T cells, increased exhausted CD8+ TEM cells, reduced MAT, NKT cells, increased γδ T cells; poor proliferation; few Treg with poor function | increased total B cells, reduced memory B cells Poor peripheral B cell tolerance. | Low IgM, normal/high IgG and IgA, very high IgE, poor antibody responses  | Low NK cells with poor function. Eosinophilia, recurrent infections, cutaneous viral, fungal and staphylococcal infections, severe atopy/allergic disease, cancer diathesis |
| DOCK2 deficiency                                     | <i>DOCK2</i>   | AR           | 603122   | Low   | Normal  | IgG normal or low, poor antibody responses                                | Early invasive herpes viral, bacterial infections, Normal NK cell number, but defective function. Poor interferon responses in hematopoietic and non-hematopoietic cells    |
| Polymerase and deficiency                            | <i>POLD1</i><br><i>POLD2</i>   | AR           | 174761<br>600815                               | Low CD4 T cells   | Low IgG   |   |   |

**Table 1** (continued)

| Disease                 | Genetic defect       | Inheritance | OMIM   | T cells  | B cells  | Ig  | Associated features  |
|-------------------------|----------------------|-------------|--|--|--|---|--|
| RHOH deficiency         | <i>RHOH</i> AR       | 602037      | Normal, few naïve T cells, restricted repertoire, poor proliferation to CD3  | Low B cells but normal maturation                    | Normal   | Normal  | Recurrent respiratory tract infections, skin infections, warts and molluscum, short stature, intellectual disability |
| STK4 deficiency         | <i>STK4</i> AR       | 614868      | CD4 lymphopenia, reduced naïve T cells, increased TEM and TEMRA cells, poor proliferation  | Reduced memory B cells                               | Reduced IgM, increased IgG, IgA, IgE; impaired Ab responses            | Intermittent neutropenia, bacterial, viral (HPV, EBV, molluscum), candidal infections, lymphoproliferation, autoimmune cytopenias, lymphoma, congenital heart disease |  |
| TCR $\alpha$ deficiency | <i>TRAC</i> AR       | 615387      | Absent TCR $\alpha\beta$ except for a minor CD3-dim TCR $\alpha\beta$ population; most T cells $\gamma\delta$ ; poor proliferation | Normal   | Normal   | Recurrent viral, bacterial, fungal infections, immune dysregulation and autoimmunity, diarrhea  |  |
| LCK deficiency          | <i>LCK</i> AR        | 615758      | Low CD4 $^+$ , low Treg, restricted T cell repertoire, poor TCR signaling  | Normal   | Normal IgG and IgA, high IgM   | Recurrent infections, immune dysregulation, autoimmunity  |  |
| ITK deficiency          | <i>ITK</i> AR        | 186973      | Progressive CD4 T cell lymphopenia; reduced T cell activation  | Normal   | Normal to low serum Ig   | EBV associated B cell lymphoproliferation, lymphoma, immune dysregulation   |  |
| MALTI deficiency        | <i>MALTI</i> AR      | 615468      | Normal number, poor proliferation  | Normal   | Normal levels, poor specific antibody response                         | Bacterial, fungal and viral infections  |  |
| CARD11 deficiency       | <i>CARD11</i> AR LOF | 615206      | Normal number, predominantly naive T cells, poor proliferation   | Normal transitional B cell predominance              | Absent/low   | <i>Pneumocystis jirovecii</i> pneumonia, bacterial and viral infections   |  |
| BCL10 deficiency        | <i>BCL10</i> AR      | 616098      | Normal number, few memory T and Treg cells, poor antigen and anti-CD3 proliferation  | Normal number, decreased memory and switched B cells | Low  | Recurrent bacterial and viral infections, candidiasis, gastroenteritis  |  |
| IL-21 deficiency        | <i>IL21</i> AR       | 615767      | Normal number, normal/low function   | Low, decreased memory and switched B cells           | Hypogammaglobulinemia, poor specific antibody responses; increased IgE | Severe early onset colitis, recurrent sinopulmonary infections  |  |
| IL-21R deficiency       | <i>IL21R</i> AR      | 615207      | Normal number, low cytokine production, poor antigen proliferation   | Normal, decreased memory and switched B cells        |  |   |  |
| OX40 deficiency         | <i>TNFRSF4</i> AR    | 615593      | Normal numbers, low antigen specific memory CD4 $^+$   | Normal numbers, low memory B cells                   | Normal   | Recurrent infections, <i>Pneumocystis jirovecii</i> , <i>Cryptosporidium</i> infections, liver disease  |  |
| IKBKB deficiency        | <i>IKBKB</i> AR      | 615592      | Normal number, absent Treg and $\gamma\delta$ T cells, impaired TCR activation   | Normal number, poor function                         | Low  | Impaired immunity to HHV8, Kaposi's sarcoma   |  |
|                         |                      |             |  |  |  | Recurrent bacterial, viral, fungal infections, opportunistic infections   |  |

**Table 1** (continued)

| Disease                 | Genetic defect    | Inheritance | OMIM   | T cells   | B cells  | Ig  | Associated features   |
|-------------------------|-------------------|-------------|--------|---|--|---|---|
| NIK deficiency          | <i>MAP3K14</i> AR |             | 604655 | Normal number, poor proliferation to antigen  | Low, low switched memory B cells                                       | Low Ig's  | Low NK number and function, recurrent bacterial, viral and <i>Cryptosporidium</i> infections  |
| RelB deficiency         | <i>RELB</i> AR    |             | 604758 | Normal number, poor diversity, reduced proliferation to mitogens; no response to Ag | Marked increase in B cell number                                       | Normal Ig levels but impaired specific antibody responses | Recurrent infections  |
| RelA haploinsufficiency | <i>RELA</i> AD    |             | 618287 | Normal/increased  | Normal   | Normal  | Chronic mucocutaneous ulceration, Impaired NFkB activation; reduced production of inflammatory cytokines  |
| Moesin deficiency       | <i>MSVN</i> XL    |             | 300988 | Normal number, defective migration, proliferation                                   | Low number   | Low Ig's over time  | Recurrent infections with bacteria, vanicella, neutropenia  |
| TFRC deficiency         | <i>TFRC</i> AR    |             | 616740 | Normal number, poor proliferation   | Normal number, low memory B cells                                      | Low   | Recurrent infections, neutropenia, thrombocytopenia   |
| c-Rel deficiency        | <i>REL</i> AR     |             | 164910 | Normal, decreased memory CD4, poor proliferation                                    | Low, mostly naïve; few switched memory B cells, impaired proliferation | Low, poor specific antibody responses                     | Recurrent infections with bacteria, mycobacteria, salmonella and opportunistic organisms.   |
| FCHO1 deficiency        | <i>FCHO1</i> AR   |             | 613437 | Low, poor proliferation   | Normal number  | Normal  | Defective innate immunity Recurrent infections (viral, mycobacteria, bacterial, fungal), lymphoproliferation, failure to thrive, increased activation-induced T cell death, defective clathrin-mediated endocytosis |

**SCID/CID spectrum:** Infants with SCID who have maternal T cell engraftment may have T cells in normal numbers that do not function normally; these cells may cause autoimmune cytopenias or graft versus host disease. Hypomorphic mutations in several of the genes that cause SCID may result in Omenn syndrome (OS), or “leaky” SCID, or still less profound combined immunodeficiency (CID) phenotypes. Both OS and leaky SCID can be associated with >300 autologous T cells/ $\mu$ L of peripheral blood and reduced, rather than absent, proliferative responses when compared with typical SCID caused by null mutations. A spectrum of clinical findings including typical SCID, OS, leaky SCID, CID, granulomas with T lymphopenia, autoimmunity and CD4 T lymphopenia can be found in an allelic series of *RAG1/2* and other SCID-associated genes. There can be clinical overlap between some genes listed here and those listed in Table 7

Total number of disorders in Table 1: 50

Total number of mutant genes: 58

New inborn errors of immunity: 8; New inborn errors of immunity: 8; *RAC2* GOF [42–45]; *ICOSLG* [53]; AD DN *IKZF1* [38]; *POLD1* [54, 55]; *POLD2* [54]; *RELA* [56, 57]; *REL* [58]; *FCHO1* [59]

**SCID** severe combined immunodeficiency, **CID** combined immunodeficiency, **EBV** Epstein-Barr virus, **MHC** major histocompatibility complex, **HPV** human papillomavirus, **Treg** T regulatory cell, **XL** X-linked inheritance, **AR** autosomal recessive inheritance, **AD** autosomal dominant inheritance, **LOF** loss-of-function, **GOF** gain-of-function

**Table 2** Combined immunodeficiencies with associated or syndromic features

| Disease   | Genetic defect | Inheritance | OMIM                | T cells   | B cells             | Ig   | Associated features   |
|---|----------------|-------------|---------------------|---|---------------------|--|---|
| <b>1. Immunodeficiency with congenital thrombocytopenia</b>                               |                |             |                     |   |                     |  |   |
| Wiskott-Aldrich syndrome (WAS LOF)  | <i>WAS</i>     | XL          | 300392              | Progressive decrease in numbers, abnormal lymphocyte responses to anti-CD3                                      | Nomal numbers       | Low IgM and antibody responses to polysaccharides, often high IgA and IgE                    | Thrombocytopenia with small platelets, recurrent bacterial/viral infections, bloody diarrhea, lymphoma, autoimmune disease, IgA- nephropathy. Patients with XL-thrombocytopenia have later onset of complications and more favourable life expectancy but eventually develop similar complications as observed in WAS |
| WIP deficiency  | <i>WIPF1</i>   | AR          | 602357              | Reduced, defective lymphocyte responses to anti-CD3   | Normal or low       | Normal, except for high IgE  | Thrombocytopenia with or without small platelets, recurrent bacterial and viral infections, eczema, bloody diarrhea; WAS protein absent   |
| Arp2/3-mediated filament branching defect   | <i>ARPC1B</i>  | AR          | 604223              | Normal  | Nomal numbers       | Normal except for high IgA and IgE   | Mild thrombocytopenia with normal sized platelets, recurrent invasive infections; colitis, vasculitis, autoantibodies (ANA, ANCA), eosinophilia; defective Arp2/3 filament branching  |
| <b>2. DNA repair defects other than those listed in Table 1</b>                           |                |             |                     |   |                     |  |   |
| Ataxia-telangiectasia   | <i>ATM</i>     | AR          | 607585              | Progressive decrease, poor proliferation to mitogens; may have low TRECs and T cells by newborn screening (NBS) | Normal              | Often low IgA, IgE and IgG subclasses, increased IgM monomers; antibodies variably decreased | Ataxia, telangiectasia especially of sclerae; pulmonary infections; lymphoreticular and other malignancies; increased alpha fetoprotein; increased radiosensitivity, chromosomal instability and chromosomal translocations   |
| Nijmegen breakage syndrome  | <i>NBS1</i>    | AR          | 602667              | Progressive decrease; may have low TRECs and T cells by NBS   | Variably reduced    | Often low IgA, IgE, and IgG subclasses, increased IgM; antibodies variably decreased         | Microcephaly, dysmorphic facies; lymphomas and solid tumors; increased radiosensitivity;, chromosomal instability   |
| Bloom syndrome  | <i>BLM</i>     | AR          | 604610              | Normal  | Normal              | Low  | Short stature, dysmorphic facies sun-sensitive erythema; marrow failure; leukemia, lymphoma; chromosomal instability  |
| Immunodeficiency with centromeric instability and facial anomalies (ICF types 1, 2, 3, 4) | <i>DNM3B</i>   | AR          | 602900              | Decreased or normal, responses to PHA may be decreased  | Decreased or normal | Hypogammaglobulinemia or agammaglobulinemia, variable antibody deficiency                    | Facial dysmorphic features, developmental delay, macroglossia; bacterial/opportunistic infections; malabsorption; cytopenias; malignancies; multiradial configurations of chromosomes 1, 9, 16  |
| <i>ZBTB24</i>   | AR             | 614064      | Decreased or normal |   |                     |  |   |

**Table 2** (continued)

| Disease   | Genetic defect        | Inheritance | OMIM   | T cells  | B cells   | Ig   | Associated features  |
|---|-----------------------|-------------|--------|--|---|--|--|
|   | <i>CDCA7</i>          | AR          | 609937 | Decreased or normal; responses to PHA may be decreased   |   |  | Facial dysmorphic features, macroglossia; bacterial/opportunistic infections; malabsorption; cytophenias; malignancies; multiradial configurations of chromosomes 1, 9, 16 |
|   | <i>HELLS</i>          | AR          | 603946 | Decreased or normal  |   |  | Recurrent infections: café-au-lait spots; lymphoma, colorectal carcinoma, brain tumors   |
| PMS2 deficiency   | <i>PMS2</i>           | AR          | 600259 | Normal   | Low B cells, switched and non-switched IgM, abnormal antibody responses | Low IgG and IgA, high IgM  | Short stature, mild defect of motor control to axia; normal intelligence to learning difficulties; mild facial dysmorphism to microcephaly; increased radiosensitivity     |
| RNF168 deficiency (Radiosensitivity, Immune Deficiency, Dysmorphic features, Learning difficulties [RIDDLE] syndrome) | <i>RNF168</i>         | AR          | 612688 | Normal   | Normal  | Low IgG or IgA   | NK cells: low number and function; viral infections (EBV, HSV, VZV); short stature; B cell lymphoma; adrenal failure   |
| MCM4 deficiency   | <i>MCM4</i>           | AR          | 602638 | Normal   | Normal  |  | Recurrent respiratory infections, meningitis; facial dysmorphism, livido, short stature  |
| POLE1 (Polymerase ε subunit 1) deficiency (FILS syndrome)   | <i>POLE1</i>          | AR          | 174762 | Normal; decreased T cell proliferation   | Low memory B cells  | Low IgG2 and IgM, lack of antibody to PPS                                    | Recurrent infections, disseminated BCG infections; autoimmunity (type 1 diabetes) hypothyroidism, facial dysmorphism   |
| POLE2 (Polymerase ε subunit 2) deficiency   | <i>POLE2</i>          | AR          | 602670 | Lymphopenia, lack of TRECs at NBS, absent proliferation in response to antigens                        | Very low  | Hypogammaglobulinemia  | Recurrent bacterial and viral infections; growth retardation; sun sensitivity, radiation sensitivity; macrocytic red blood cells   |
| Ligase I deficiency   | <i>LIG1</i>           | AR          | 126391 | Lymphopenia, increased γδ T cells, decreased mitogen response  | Normal  | Reduced antibody responses   | Severe lung disease (possibly viral); thymic hypoplasia; chromosomal breakage, radiation sensitivity   |
| NSMCE3 deficiency   | <i>NSMCE3</i>         | AR          | 608243 | Decreased number, poor responses to mitogens and antigens  | Normal  | Normal IgG, IgA, normal to elevated IgM; decreased antibody responses to PPS | Facial dysmorphism, microcephaly; bone marrow failure  |
| ERCC6L2 (Hebo deficiency)   | <i>ERCC6L2</i>        | AR          | 615667 | Lymphopenia  | Low   | Normal   | Neutropenia; NK cells very low   |
| GINS1 deficiency  | <i>GINS1</i>          | AR          | 610608 | Low or normal  | Low or normal   | High IgA, low IgM and IgG  |  |
| <b>3. Thymic defects with additional congenital anomalies</b>   |                       |             |        |  |   |  |  |
| DiGeorge/velocardio-facial syndrome   | Large deletion (3 Mb) | AD          | 602054 | Decreased or normal, 5% have low TREC <sub>S</sub> at NBS and < 1500 CD3 T cells/μL in neonatal period | Normal  | Normal or decreased  | Hypoparathyroidism; conotruncal cardiac malformation, velopatatal insufficiency; abnormal facies; intellectual disability  |
| Chromosome 22q11.2 deletion syndrome (22q11.2DS)  |                       |             |        |  |   |  |  |

**Table 2** (continued)

| Disease  | Genetic defect                              | Inheritance | OMIM             | T cells  | B cells   | Ig   | Associated features  |
|--|---|-------------|------------------|--|---|--|--|
| DiGeorge/velocardio-facial syndrome TBX1 deficiency  | chromosome 22 (TBX1)<br>Unknown <i>TBX1</i> | Sporadic AD | 602054           | Decreased or normal<br>have low TREC <sub>s</sub> at NBS   | Normal  | Normal or decreased  | Coloboma of eye; heart anomaly; choanal atresia; intellectual disability; genital and ear anomalies; CNS malformation; some are SCID-like  |
| CHARGE syndrome                                      | <i>CHD7</i><br><i>SEMA3E</i><br>Unknown     | AD<br>AD    | 608892<br>608166 | Decreased or normal, may have low TREC <sub>s</sub> at NBS;<br>response to PHA may be decreased                          | Normal  | Not assessed   | Severe infections; abnormal thymic epithelium, immunodeficiency; congenital alopecia, nail dystrophy; neural tube defect   |
| Winged helix nude FOXN1 deficiency                   | <i>FOXN1</i>                                | AR          | 601705           | Very low   | Normal  | Decreased  | Recurrent, viral and bacterial respiratory tract infections; skin involvement (eczema, dermatitis), nail dystrophy Hypoparathyroidism; renal disease; deafness; growth retardation; facial dysmorphism; cardiac defects may be present; recurrent infections ± |
| FOXN1 haploinsufficiency                             | <i>FOXN1</i>                                | AD          | 600838           | Severe T cell lymphopenia at birth, normalised by adulthood  | Normal/low  | Not assessed   |  |
| Chromosome 10p13-p14 deletion syndrome (10p13-p14DS) | <i>DellOp13-p14</i>                         | AD          | 601362           | Normal, rarely lymphopenia and decreased lymphoproliferation to mitogens and antigens; hypoplastic thymus may be present | Normal  | Normal   |  |
| Chromosome 11q deletion syndrome (Jacobson syndrome) | <i>11q23delet</i>                           | AD          | 147791           | Lymphopenia; low NK cells<br>switched memory B cells   | Decreased B cells and Hypogammaglobulinemia, decreased antibody responses | Recurrent respiratory infections; multiple warts; facial dysmorphism, growth retardation | Recurrent respiratory infections; multiple warts; facial dysmorphism, growth retardation   |
| <b>4. Immuno-osseous dysplasias</b>                  |   |             |                  |  |   |  |  |
| Cartilage hair hypoplasia (CHH)                      | <i>RMRP</i>                                 | AR          | 157660           | Varies from severely decreased (SCID) to normal; impaired lymphocyte proliferation                                       | Normal  | Normal or reduced, antibodies variably decreased   | Short-limbed dwarfism with metaphyseal dysostosis; sparse hair; bone marrow failure; autoimmunity; susceptibility to lymphoma and other cancers; impaired spermatogenesis; neuronal dysplasia of the intestine   |
| Schimke immuno-osseous dysplasia                     | <i>SMARCAL1</i>                             | AR          | 606622           | Decreased  | Normal  | Normal   | Short stature, spondyloepiphyseal dysplasia, intrauterine growth retardation; nephropathy; bacterial, viral, fungal infections; may present as SCID; bone marrow failure   |
| MYSM1 deficiency                                     | <i>MYSM1</i>                                | AR          | 612176           | T cell lymphopenia, reduced naïve T cells, low NK cells  | B cell deficiency   | Hypogammaglobulinemia  | Short stature; recurrent infections; congenital bone marrow failure, myelodysplasia; immunodeficiency affecting B cells and granulocytes; skeletal anomalies; cataracts; developmental delay   |

**Table 2** (continued)

| Disease   | Genetic defect  | Inheritance                | OMIM   | T cells  | B cells   | Ig  | Associated features  |
|---|-----------------|----------------------------|--------|--|---|---|--|
| MOPD1 deficiency (Roifman syndrome)   | <i>RNU4ATAC</i> | AR                         | 601428 | Decreased NK cell function   | Decreased total and memory B cells  | Hypogammaglobulinemia, variably decreased specific antibodies               | Recurrent bacterial infections; lymphadenopathy; spondyloepiphyseal dysplasia, extreme intrauterine growth retardation; retinal dystrophy; facial dysmorphism; may present with microcephaly; short stature  |
| Immunoskeletal dysplasia with neurodevelopmental abnormalities (EXTL3 deficiency) | <i>EXTL3</i>    | AR                         | 617425 | Decreased  | Normal  | Decreased to normal   | Short stature; cervical spinal stenosis, neurodevelopmental impairment; eosinophilia; may have early infant mortality  |
| <b>5. Hyper IgE syndromes (HIES)</b><br>AD-HIES STAT3 deficiency (Job syndrome)   | <i>STAT3</i>    | AD LOF (dominant negative) | 147060 | Normal overall; Th1/T follicular helper, MAIT, NKT cells decreased, Tregs may be increased; impaired responses to STAT3-activating cytokines | Normal, reduced memory B cells, BAFF expression increased, impaired responses to STAT3-activating cytokines | Very high IgE, specific antibody production decreased                       | Distinctive facial features (broad nasal bridge); bacterial infections (boils, pulmonary abscesses, pneumatoceles) due to <i>S. aureus</i> , pulmonary aspergillosis, <i>Pneumocystis jirovecii</i> ; eczema, mucocutaneous candidiasis, hyperextensible joints, osteoporosis and bone fractures, scoliosis, retained primary teeth; coronary and cerebral aneurysns |
| IL6 receptor deficiency   | <i>IL6R</i>     | AR                         | 147880 | Normal/increased; normal responses to mitogens   | Normal total and memory B; reduced switched memory B  | Normal/low serum IgM, G, A. Very high IgE; specific antibody production low | Recurrent pyogenic infections, cold abscesses; high circulating IL-6 levels  |
| IL6 signal transducer (IL6ST) deficiency  | <i>IL6ST</i>    | AR                         | 618523 | Decreased Th17 cells   | Reduced switched and non-switched memory B cells  | High IgE, specific antibody production variably affected                    | Bacterial infections, boils, eczema, pulmonary abscesses, pneumatoceles; bone fractures; scoliosis; retention of primary teeth; craniosynostosis   |
| ZNF341 deficiency<br>AR-HIES  | <i>ZNF341</i>   | AR                         | 618282 | Decreased Th17 and NK cells  | Normal, reduced memory B cells, impaired responses to STAT3-activating cytokines                            | High IgE and IgG, specific antibody production decreased                    | Phenotype of AD-HIES; mild facial dysmorphism; early onset eczema, MC/C, bacterial skin infections, abscesses, recurrent bacterial respiratory infections ( <i>S. aureus</i> ), lung abscesses and pneumatoceles; hyperextensible joints; bone fractures and retention of primary teeth  |
| ERBIN deficiency  | <i>ERBB2IP</i>  | AD                         | 606944 | Increased circulating Treg   | Normal  | Moderately increased IgE  | Recurrent respiratory infections, susceptibility to <i>S. aureus</i> , eczema; hyperextensible joints, scoliosis; arterial dilatation in some patients   |

**Table 2** (continued)

| Disease   | Genetic defect                 | Inheritance                | OMIM             | T cells   | B cells  | Ig  | Associated features  |
|---|--------------------------------|----------------------------|------------------|---|--|---|--|
| Loeys-Dietz syndrome (TGFBR deficiency)                                       | <i>TGFBR1</i><br><i>TGFBR2</i> | AD                         | 609192<br>610168 | Normal  | Normal   | Elevated IgE  | Recurrent respiratory infections; eczema, food allergies; hyper-extensible joints, scoliosis, retention of primary teeth; aortic aneurisms.  |
| Cornel-Netherton syndrome   | <i>SPINK5</i>                  | AR                         | 605010           | Normal  | Low switched and non-switched B cells                          | High IgE and IgA, Antibody variably decreased   | Congenital ichthyosis, bamboo hair, atopic diathesis; increased bacterial infections; failure to thrive  |
| PGM3 deficiency   | <i>PGM3</i>                    | AR                         | 172100           | CD8 and CD4 T cells may be decreased  | Low B and memory B cells                                       | Normal or elevated IgG and IgA, most with high IgE, eosinophilia  | Severe atopy; autoimmunity; bacterial and viral infections; skeletal anomalies/dysplasia; short stature, brachydactyly, dysmorphic facial features; intellectual disability and cognitive impairment, delayed CNS myelination in some affected individuals |
| CARD11 deficiency (heterozygous)  | <i>CARD11</i>                  | AD LOF (dominant-negative) | 617638           | Normal overall, but defective T cell activation and proliferation; skewing toward TH2 | Normal to low  | High IgE, poor specific antibody production; impaired activation of both NF-κB and mTORC1 pathways                        | Variable atopy, eczema, food allergies, eosinophilia; cutaneous viral infections, recurrent respiratory infections; lymphoma; CID  |
| <b>6. Defects of vitamin B12 and folate metabolism</b>                        |                                |                            |                  |   |  | Decreased   | Megaloblastic anemia, pancytopenia; if untreated (B12) for prolonged periods results in intellectual disability  |
| Transcobalamin 2 deficiency   | <i>TCN2</i>                    | AR                         | 613441           | Normal  | Variable   | Decreased   | Megaloblastic anemia, failure to thrive; if untreated for prolonged periods results in intellectual disability   |
| SLC46A1/PCFT deficiency causing hereditary folate malabsorption               | <i>SLC46A1</i>                 | AR                         | 229050           | Variable numbers and activation profile   | Variable   | Decreased   | Recurrent bacterial infection, <i>Pneumocystis jirovecii</i> ; megaloblastic anemia; failure to thrive; neutropenia; seizures, intellectual disability; folate responsive  |
| Methylene-tetrahydrofolate dehydrogenase 1 (MTHFD1) deficiency                | <i>MTHFD1</i>                  | AR                         | 172460           | Low thymic output, normal in vitro proliferation                                      | Low  | Decreased/poor antibody responses to conjugated polysaccharide antigens   | Anhidrotic ectodermal dysplasia (in some); various infections (bacteria, mycobacteria, viruses, fungi); colitis; conical teeth, variable defects of skin, hair and teeth; monocyte dysfunction   |
| <b>7. Anhidrotic ectoderm dysplasia with immunodeficiency (EDA-ID)</b>        |                                |                            |                  |   |  |   |  |
| EDA-ID due to NEMO/IKBKG deficiency (ectodermal dysplasia, immune deficiency) | <i>IKBKG</i>                   | XL                         | 300248           | Normal or decreased, TCR activation impaired  | Normal; Low memory and isotype switched B cells                | Decreased, some with elevated IgA, IgM, poor specific antibody responses, absent antibodies to polysaccharide antigens    | Decreased IgG and IgA, elevated IgM, poor specific antibody responses, absent  |
| EDA-ID due to IKBA GOF mutation   | <i>NFKBIA</i>                  | AD GOF                     | 164008           | Normal total T cells, TCR activation impaired   | Normal B cell numbers, impaired BCR activation, low memory and | Antihidrotic ectodermal dysplasia; various infections (bacteria, mycobacteria, viruses, fungi); colitis; variable defects |  |

**Table 2** (continued)

| Disease   | Genetic defect                | Inheritance | OMIM             | T cells  | B cells   | Ig  | Associated features   |
|---|-------------------------------|-------------|------------------|--|---|---|---|
| EDA-ID due to <i>IKBKB</i> GOF mutation                     | <i>IKBKB</i>                  | AD GOF      | 618204           | Decreased T cells, impaired TCR activation   | Normal number, poor function                    | Reduced antibody to polysaccharide antigens                             | of skin, hair and teeth; T cell and monocyte dysfunction<br>Recurrent bacterial, viral, fungal infections; variable ectodermal defects  |
| <b>8. Calcium channel defects</b>                           |                               |             |                  |  |   |   |   |
| ORAI-1 deficiency   | <i>ORAI1</i>                  | AR          | 610277           | Normal, defective TCR mediated activation  | Normal  | Normal  | Autoimmunity; EDA; non-progressive myopathy   |
| STIM1 deficiency  | <i>STIM1</i>                  | AR          | 605921           |  |   |   |   |
| <b>9. Other defects</b>                                     |                               |             |                  |  |   |   |   |
| Purine nucleoside phosphorylase (PNP)                       | <i>PNP</i>                    | AR          | 164050           | Progressive decrease   | Normal  | Normal or low   | Autoimmune hemolytic anemia; neurological impairment  |
| Immunodeficiency with multiple intestinal atresias          | <i>TTC7A</i>                  | AR          | 609332           | Variable, but sometimes absent or low TREC <sub>s</sub> at NBS; may have SCID phenotype at birth | Normal or low                                   | Markedly decreased IgG, IgM, IgA  | Bacterial (sepsis), fungal, viral infections; multiple intestinal atresias, often with intrauterine polyhydramnios and early demise   |
| Tricho-Hepato-Enteric Syndrome (THE) <sup>a</sup>           | <i>TTC37</i><br><i>SKIV2L</i> | AR          | 222470<br>614602 | Impaired IFN $\gamma$ production   | Variably low numbers of switched memory B cells | Hypogammaglobulinemia, may have low antibody responses                  | Respiratory infections; IUGR; facial dysmorphic features, wooly hair; early onset intractable diarrhea, liver cirrhosis; platelet abnormalities                                 |
| Hepatic veno-occlusive disease with immunodeficiency (VODI) | <i>SP110</i>                  | AR          | 604457           | Normal (decreased memory T cells)  | Normal (decreased memory B cells)               | Decreased IgG, IgA, IgM, absent germinal center and tissue plasma cells | Hepatic veno-occlusive disease; susceptibility to <i>Pneumocystis jirovecii</i> pneumonia, CMV, candida; hepatosplenomegaly; cerebrospinal leukodystrophy                       |
| <i>BCL11B</i> deficiency                                    | <i>BCL11B</i>                 | AD          | 617237           | Low, poor proliferation  | Normal  | Normal  | Congenital abnormalities, neonatal teeth, dysmorphic facies; absent corpus callosum, neurocognitive deficits  |
| EPG5 deficiency (Vici syndrome)                             | <i>EPG5</i>                   | AR          | 615068           | Profound depletion of CD4+ cells   | Defective                                       | Decreased (particularly IgG2)   | Agensis of the corpus callosum; cataracts; cardiomopathy; skin hypopigmentation; intellectual disability; microcephaly; recurrent infections, chronic mucocutaneous candidiasis |
| HOIL1 deficiency  | <i>RBCK1</i>                  | AR          | 610924           | Normal numbers   | Normal, decreased memory B cells                | Poor antibody responses to polysaccharides                              | Bacterial infections; autoinflammation; amylopectinosis   |
| HOIP deficiency   | <i>RNF31</i>                  | AR          | 612487           | Normal numbers   | Normal, decreased memory B cells                | decreased   | Bacterial infections; autoinflammation; amylopectinosis; lymphangiectasia   |
| Hennekam-lymphangiectasia-lymphedema syndrome               | <i>CCBE1</i>                  | AR          | 612753           | Low/variable   | Low/variable                                    | decreased   | Lymphangiectasia and lymphedema with facial abnormalities and other dysmorphic features   |
|   | <i>FAT4</i>                   | AR          | 612411           | Low/variable   | Low/variable                                    | decreased   |   |

**Table 2** (continued)

| Disease   | Genetic defect               | Inheritance                           | OMIM             | T cells  | B cells  | Ig  | Associated features  |
|---|------------------------------|---------------------------------------|------------------|--|--|---|--|
| Activating de novo mutations in nuclear factor, erythroid 2-like (NFE2L2) | <i>NFE2L2</i>                | AD                                    | 617744           | Not reported   | Decreased switched memory B cells                  | Hypogammaglobulinemia, decreased antibody responses | Lymphangiectasia and lymphedema with facial abnormalities and other dysmorphic features<br>Recurrent respiratory and skin infections; growth retardation, developmental delay; white matter cerebral lesions; increased level of homocysteine; increased expression of stress response genes   |
| STAT5b deficiency   | <i>STAT5B</i>                | AR                                    | 245590           | Modestly decreased, reduced Treg number and function | Normal   | hyper gammaglobulinemia, increased IgE              | Growth-hormone insensitive dwarfism; dysmorphic features; eczema; lymphocytic interstitial pneumonitis; prominent autoimmunity<br>Growth-failure; eczema (no immune defects compared to AR STAT5 deficiency)   |
| STAT5b deficiency   | <i>STAT5B</i>                | AD (dominant-negative)                | 604260           | Normal   | Normal   | Increased IgE                                       |  |
| Kabuki syndrome (type 1 and 2)  | <i>KMT2D</i><br><i>KDM6A</i> | AD<br>XL<br>(females may be affected) | 602113<br>300128 | Normal   | Normal   | Low IgA and occasionally low IgG                    | Typical facial abnormalities, cleft or high arched palate, skeletal abnormalities, short stature; intellectual disability; congenital heart defects; recurrent infections (otitis media, pneumonia) in 50% of patients; autoimmunity may be present<br>Respiratory infections; short stature; hypertrichosis; hairy elbows; developmental delay, intellectual disability |
| KMT2A deficiency (Wiedemann-Steiner syndrome)                             | <i>KMT2A</i>                 | AD                                    | 605130           | Normal   | Decreased switched and non-switched memory B cells | Hypogammaglobulinemia, decreased antibody responses |  |

Total number of disorders in Table 2: 58

Total number of mutant genes in Table 2: 62

New inborn errors of immunity: 13; *LIG1* [60]; *FOXP1* haploinsufficiency [61]; *IL6R* [23, 24]; *IL6ST* [21, 22]; *ZNF341* [19, 20]; *ERBB2IP* [62]; *TGFBR1* [63]; *TGFBR2* [63]; AD LOF *CARD11* [25, 26]; AD GOF *IRBK2B* [33]; *SKIV2L* [64]; *NFE2L2* [65]; *STAT5B* AD DN [27]

Unknown cause of DiGeorge syndrome, unknown cause of CHARGE syndrome, unknown gene(s) within 10p13–14 deletion responsible for phenotype  
*EDA* ectodermal dysplasia anhydrotic, *HSV* herpes simplex virus, *VZV* varicella zoster virus, *BCG* Bacillus Calmette-Guerin, *NBS* newborn screen, *TREC* T cell receptor excision circle (biomarker for low T cells used in NBS), *IUGR* intrauterine growth retardation

**Table 3** Predominantly antibody deficiencies

| Disease   | Genetic defect    | Inheritance | OMIM  | Ig   | Associated features  |
|---|-------------------|-------------|---|--|--|
| <b>1. Severe reduction in all serum immunoglobulin isotypes with profoundly decreased or absent B cells, agammaglobulinemia</b> |                   |             |   |  |  |
| BTK deficiency, X-linked agammaglobulinemia (XLA)   | <i>BTK</i> XL     | 300300      | All isotypes decreased in majority of patients, some patients have detectable immunoglobulins | Severe bacterial infections, normal numbers of pro-B cells   |  |
| μ heavy chain deficiency  | <i>IGHM</i>       | AR          | 147020  | Severe bacterial infections, normal numbers of pro-B cells   |  |
| λ5 deficiency   | <i>IGLL1</i>      | AR          | 146770  | Severe bacterial infections, normal numbers of pro-B cells   |  |
| Igα deficiency  | <i>CD79A</i>      | AR          | 112205  | Severe bacterial infections, normal numbers of pro-B cells   |  |
| Igβ deficiency  | <i>CD79B</i>      | AR          | 147245  | Severe bacterial infections; autoimmune complications (IBD)  |  |
| BLNK deficiency   | <i>BLNK</i>       | AR          | 604515  | Severe bacterial infections, cytopenias, decreased or absent pro-B cells   |  |
| p110δ deficiency  | <i>PIK3CD</i>     | AR          | 602839  | Recurrent bacterial infections   |  |
| p85 deficiency  | <i>PIK3RI</i>     | AR          | 615214  | Severe, recurrent bacterial infections, failure to thrive  |  |
| E47 transcription factor deficiency   | <i>TCF3</i>       | AD          | 616941  | Early onset infections, blistering dermatosis, failure to thrive, thrombocytopenia   |  |
| <i>TCF3</i>   | AR                | 147141      |   | Recurrent infections, facial dysmorphism, limb anomalies   |  |
| SLC39A7 (ZIP7) deficiency   | <i>SLC39A7</i>    | AR          | 601416  |  |  |
| Hoffman syndrome/TOP2B deficiency   | <i>TOP2B</i>      | AD          | 126431  |  |  |
| <b>2. Severe reduction in at least 2 serum immunoglobulin isotypes with normal or low number of B cells, CVID phenotype</b>     |                   |             |   |  |  |
| Common variable immune deficiency with no gene defect specified (CVID)  | Unknown           | Variable    | Low IgG and IgA and/or IgM  | Clinical phenotypes vary: most have recurrent infections, some have polyclonal lymphoproliferation, autoimmune cytopenias and/or granulomatous disease                   |  |
| Activated p110δ syndrome (APDS)   | <i>PIK3CD GOF</i> | AD          | 615513 (APDS1)  | Severe bacterial infections; reduced memory B cells and increased transitional B cells, EBV ± CMV viremia, lymphadenopathy/splenomegaly, lymphoproliferation, lymphoma   |  |
|   |                   |             | 616005 (APDS2)  | Severe bacterial infections, reduced memory B cells and increased transitional B cells, lymphadenopathy/splenomegaly, lymphoproliferation, lymphoma; developmental delay |  |
| PTEN deficiency (LOF)   | <i>PTEN</i>       | AD          | 158350  | Recurrent infections, Lymphoproliferation, Autoimmunity; developmental delay   |  |
| CD19 deficiency   | <i>CD19</i>       | AR          | 107265  | Recurrent infections, may have glomerulonephritis (CD81 mutation abolishes expression of CD19, thereby pheno-copying CD19 mutations)                                     |  |
| CD81 deficiency   | <i>CD81</i>       | AR          | 186845  | Recurrent infections   |  |
| CD20 deficiency   | <i>CD20</i>       | AR          | 112210  | Low IgG, normal or elevated IgM and IgA  |  |
| CD21 deficiency   | <i>CD21</i>       | AR          | 120650  | Low IgG, impaired anti-pneumococcal response   |  |
| TACI deficiency <sup>#</sup>  | <i>TNFRSF13B</i>  | AR or AD    | 604907  | Low IgG and IgA and/or IgM   | Variable clinical expression and penetrance for monoallelic variants |

**Table 3** (continued)

| Disease   |                  | Genetic defect                            | Inheritance | OMIM  | Ig | Associated features  |
|---|------------------|---|-------------|---|----|--|
| BAFF receptor deficiency  | <i>TNFRSF13C</i> | AR  | 606269      | Low IgG and IgM;  |    |  |
| TWEAK deficiency  | <i>TNFSF12</i>   | AD  | 602695      | Low IgM and A; lack of anti-pneumococcal antibody   |    |  |
| TRNT1 deficiency  | <i>TRNT1</i>     | AR  | 612907      | B cell deficiency and hypogammaglobulinemia   |    | Pneumonia, bacterial infections, warts, thrombocytopenia. Neutropenia  |
| NFKB1 deficiency  | <i>NFKB1</i>     | AD  | 164011      | Normal or low IgG, IgA, IgM, low or normal B cells, low memory B cells  |    | Congenital sideroblastic anemia, deafness, developmental delay   |
| NFKB2 deficiency  | <i>NFKB2</i>     | AD  | 615577      | Low serum IgG, A and M; low B cell numbers  |    | Recurrent sinopulmonary infections, alopecia and autoimmunity  |
| IKAROS deficiency   | <i>IKZF1</i>     | AD (haploinsufficiency)                   | 603023      | Low IgG, IgA, IgM, low or normal B cells; B cells and Ig levels reduce with age                                       |    | Decreased pro-B cells, recurrent sinopulmonary infections; increased risk of ALL, autoimmunity, CVID phenotype                   |
| IRF2BP2 deficiency  | <i>IRF2BP2</i>   | AD  | 615332      | Hypogammaglobulinemia, absent IgA   |    | Recurrent infections, possible autoimmunity and inflammatory disease   |
| ATP6AP1 deficiency  | <i>ATP6AP1</i>   | XL  | 300972      | Variable immunoglobulin findings  |    | Hepatopathy, leukopenia, low copper  |
| ARHGEF1 deficiency  | <i>ARHGEF1</i>   | AR  | 618459      | Hypogammaglobulinemia; lack of antibody IgM, IgG deficiency; loss of antibody   |    | Recurrence infections, bronchiectasis  |
| SH3KBP1 (CIN85) deficiency  | <i>SH3KBP1</i>   | XL  | 300310      | Hypogammaglobulinemia   |    | Severe bacterial infections  |
| SEC61A1 deficiency  | <i>SEC61A1</i>   | AD  | 609213      | Low IgG, IgA, IgM, low or normal B cells; reduced Ab responses  |    | Severe recurrent respiratory tract infections  |
| RAC2 deficiency   | <i>RAC2</i>      | AR  | 602049      | Following vaccination   |    | Recurrent sinopulmonary infections, selective IgA deficiency; poststreptococcal glomerulonephritis; urticaria                    |
| Mannosyl-oligosaccharide glucosidase deficiency   | <i>MOGS</i>      | AR  | 601336      | Low IgG, IgA, IgM, increased B cells; poor Ab responses following vaccination   |    | Bacterial and viral infections; severe neurologic disease; also known as congenital disorder of glycosylation type IIb (CDG-IIb) |
| <b>3. Severe reduction in serum IgG and IgA with normal/elevated IgM and normal numbers of B cells, hyper IgM</b> |                  |   |             |   |    |  |
| AID deficiency  | <i>AID/ADA</i>   | AR  | 6055258     | IgG and IgA decreased, IgM increased; normal memory B cells but lacking somatic hypermutation                         |    | Bacterial infections, enlarged lymph nodes and germinal centers; autoimmunity  |
|   |                  | AD  | 605257      | IgG absent or decreased, IgA undetected, IgM increased; normal memory B cells with intact somatic hypermutation       |    | Bacterial infections, enlarged lymph nodes and germinal centers. Mutations uniquely localize to the nuclear export signal.       |
| UNG deficiency  | <i>UNG</i>       | AR  | 191525      | IgG and IgA decreased, IgM increased  |    | Enlarged lymph nodes and germinal centers  |
| INO80 deficiency  | <i>INO80</i>     | AR  | 610169      | Variable IgG, defects, increased IgM  |    | Severe bacterial infections  |
| MSH6 deficiency   | <i>MSH6</i>      | AR  | 600678      | in some, normal B cells, low switched memory B cells, Ig class switch recombination and somatic hypermutation defects |    | Family or personal history of cancer   |
| <b>4. Isotype, light chain, or functional deficiencies with generally normal numbers of B cells</b>               |                  |   |             |   |    |  |
| Ig heavy chain mutations and deletions  |                  | Mutation or chromosomal deletion at 14q12 | AR          | One or more IgG and/or IgA subclasses as well as IgE may be absent  |    | May be asymptomatic  |
| Kappa chain deficiency  | <i>IGKC</i>      | AR  | 147200      | All immunoglobulins have lambda light chain   |    | Asymptomatic   |
| Isolated IgG subclass deficiency  | Unknown          | ?   |             | Reduction in one or more IgG subclass   |    |  |

**Table 3** (continued)

| Disease   |               | Genetic defect | Inheritance | OMIM   | Ig   | Associated features  |
|---|---------------|----------------|-------------|--|--|--|
| IgG subclass deficiency with IgA deficiency                           | Unknown       | ?              |             |  | Reduced IgA with decrease in one or more IgG subclass                            | Usually asymptomatic, a minority may have poor antibody response to specific antigens and recurrent viral/bacterial infections |
| May be asymptomatic Selective IgA deficiency                          | Unknown       | ?              |             |  | Absent IgA with other isotypes normal, normal subclasses and specific antibodies | May be asymptomatic Bacterial infections, autoimmunity mildly increased  |
| Specific antibody deficiency with normal Ig levels and normal B cells | Unknown       | ?              |             |  | Normal   | Reduced ability to produce antibodies to specific antigens   |
| Transient hypogammaglobulinemia of infancy                            | Unknown       | ?              |             |  | IgG and IgA decreased  | Normal ability to produce antibodies to vaccine antigens, usually not associated with significant infections                   |
| CARD11 GOF  | <i>CARD11</i> | AD GOF         | 616452      | Polyclonal B cell lymphocytosis due to constitutive NF-κB activation | Splenomegaly, lymphadenopathy, poor vaccine response                             |  |
| Selective IgM deficiency  | Unknown       | ?              |             | Absent serum IgM   | Pneumococcal/bacterial   |  |

Common variable immunodeficiency disorders (CVID) include several clinical and laboratory phenotypes that may be caused by distinct genetic and/or environmental factors. Some patients with CVID and no known genetic defect have markedly reduced numbers of B cells as well as hypogammaglobulinemia. Identification of causal variants can assist in defining treatment. In addition to monogenic causes on this table, a small minority of patients with XLP (Table 4), WHIM syndrome (Table 6), JCF (Table 2), VODI (Table 2), thymoma with immunodeficiency (Good syndrome), or myelodysplasia are first seen by an immunologist because of recurrent infections, hypogammaglobulinemia, and normal or reduced numbers of B cells

Total number of disorders in Table 3: 46

Total number of mutant genes in Table 3: 39

New disorders: 9: AR *PRK3CD* [35, 36, 66]; AR *TCF3* [31, 32]; *SLC39A7* [67]; *TOP2B* [68]; *ARHGEF1* [69]; *SH3KBPI* [70]; *SEC61AI* [71]; *AR LOF RAC2* [41]; AD *AICDA*

*EBV* Epstein-Barr virus, *COPD* chronic obstructive pulmonary disease

# Heterozygous variants in *TNFRSF13B* have been detected in healthy individuals, thus such variants are likely to be disease-modifying rather than disease-causing

**Table 4** Diseases of immune dysregulation

| Disease  | Genetic defect         | Inheritance | OMIM  | Circulating T cells      | Circulating B cells  | Functional defect  | Associated features |
|--|------------------------|-------------|---|--------------------------|--|--|---------------------|
| <b>1. Familial hemophagocytic lymphohistiocytosis (FHL syndromes)</b>                |                        |             |   |                          |  |  |                     |
| Perforin deficiency (FHL2)   | <i>PRF1</i> AR         | 170280      | Increased activated T cells                   | Normal                   | Decreased to absent NK and CTL activities cytotoxicity   | Fever, HSM, hemophagocytic lymphohistiocytosis (HLH), cytopenias   |                     |
| UNC13D/Munc13–4 deficiency (FHL3)  | <i>UNC13D</i> AR       | 608897      | Increased activated T cells                   | Normal                   | Decreased to absent NK and CTL activities (cytotoxicity and/or degranulation)  | Fever, HSM, HLH, cytopenias,   |                     |
| Syntaxin 11 deficiency (FHL4)  | <i>STX11</i> AR        | 605014      |   |                          |  |  |                     |
| STXBP2/Munc18–2 deficiency (FHL5)  | <i>STXBP2</i> AR or AD | 601717      |   |                          |  |  |                     |
| FAA224 deficiency  | <i>FAAAP24</i> AR      | 610884      | Increased activated T cells                   | Normal                   | Failure to kill autologous EBV transformed B cells. Normal NK cell function  | EBV-driven lymphoproliferative disease   |                     |
| SLC7A7 deficiency  | <i>SLC7A7</i> AR       | 222700      | Normal  | Normal                   | Hyper-inflammatory response of macrophages   | Lysinuric protein intolerance, bleeding tendency, alveolar proteinosis   |                     |
| <b>2. FHL syndromes with hypopigmentation</b>  |                        |             |   |                          |  |  |                     |
| Chediak-Higashi syndrome   | <i>LYST</i> AR         | 606897      | Increased activated T cells                   | Normal                   | Decreased NK and CTL activities (cytotoxicity and/or degranulation)  | Partial albinism, recurrent infections, fever, HSM, HLH, giant lysosomes, neutropenia, cytopenias, bleeding tendency, progressive neurological dysfunction                     |                     |
| Griscelli syndrome, type 2   | <i>RAB27A</i> AR       | 603868      | Normal  | Normal                   | Decreased NK and CTL activities (cytotoxicity and/or degranulation)  | Partial albinism, fever, HSM, HLH, cytopenias  |                     |
| Hermansky-Pudlak syndrome, type 2  | <i>AP3B1</i> AR        | 603401      | Normal  | Normal                   | Decreased NK and CTL activities (cytotoxicity and/or degranulation)  | Partial albinism, recurrent infections, pulmonary fibrosis, increased bleeding, neutropenia, HLH   |                     |
| Hermansky-Pudlak syndrome, type 10   | <i>AP3D1</i> AR        | 617050      | Normal  | Normal                   | Decreased NK and CTL activities (cytotoxicity and/or degranulation)  | Oculocutaneous albinism, severe neutropenia, recurrent infections, seizures, hearing loss and neurodevelopmental delay   |                     |
| <b>3. Regulatory T cell defects</b>  |                        |             |   |                          |  |  |                     |
| IPEX, immune dysregulation, polyendocrinopathy, enteropathy X-linked CD25 deficiency | <i>FOXP3</i> XL        | 300292      | Normal  | Normal                   | Lack of (and/or impaired function of) CD4 <sup>+</sup> CD25 <sup>+</sup> FOXP3 <sup>+</sup> regulatory T cells (Tregs) | Autoimmune enteropathy, early onset diabetes, thyroiditis, hemolytic anemia, thrombocytopenia, eczema, elevated IgE and IgA  |                     |
| CD122 deficiency   | <i>IL2RA</i> AR        | 147730      | Normal to decreased                           | Normal                   | No CD4 <sup>+</sup> C25 <sup>+</sup> cells with impaired function of Tregs cells                                       | Lymphoproliferation, autoimmunity, impaired T cell proliferation in vitro  |                     |
|  | <i>IL2RB</i> AR        | 618495      | Increased memory CD8 T cells, decreased Tregs | Increased memory B cells | Diminished IL2R $\beta$ expression, dysregulated signaling in response to IL-2/IL-15; increased immature NK cells      | Lymphoproliferation, lymphadenopathy, hepatosplenomegaly, autoimmune hemolytic anemia, dermatitis, enteropathy, hyper gammaglobulinemia, recurrent viral (EBV, CMV) infections |                     |
| CTLA4 haploinsufficiency (ALPS-V)  | <i>CTLA4</i> AD        | 123890      | Decreased                                     | Decreased                | Impaired function of Tregs.  | Autoimmune cytopenias, enteropathy, interstitial lung disease, extra-lymphoid lymphocytic infiltration, recurrent infections   |                     |

**Table 4** (continued)

| Disease   | Genetic defect | Inheritance | OMIM   | Circulating T cells                                  | Circulating B cells                | Functional defect  | Associated features  |
|---|----------------|-------------|--------|--|------------------------------------|--|--|
| LRBA deficiency   | <i>LRBA</i>    | AR          | 606453 | Normal or decreased CD4 numbers T cell dysregulation | Low or normal numbers of B cells   | Reduced IgG and IgA in most  | Recurrent infections, inflammatory bowel disease, autoimmunity   |
| DEF6 deficiency   | <i>DEF6</i>    | AR          | 610094 | Mild CD4 and CD8 lymphopenia                         | Low or normal numbers of B cells   | Impaired Treg function   | Enteropathy, hepatosplenomegaly, cardiomopathy, recurrent infections   |
| STAT3 GOF mutation  | <i>STAT3</i>   | AD GOF      | 102582 | Decreased  | Decreased                          | Enhanced STAT3 signaling, leading to increased Th1/7 cell differentiation, lymphoproliferation and autoimmunity. Decreased Tregs and impaired function | Lymphoproliferation, solid organ autoimmunity, recurrent infections  |
| BACH2 deficiency  | <i>BACH2</i>   | AD          | 605394 | Progressive T cell lymphopenia                       | Impaired memory B cell development | Haploinsufficiency for a critical lineage specification transcription factor   | Lymphocytic colitis, sinopulmonary infections  |
| FERMT1 deficiency   | <i>FERMT1</i>  | AR          | 173650 | Normal   | Nomal                              | Intracellular accumulation of IgG, IgM, IgA, and C3 in colloid bodies under the basement membrane  | Dermatoses characterized by congenital blistering, skin atrophy, photosensitivity, skin fragility, and scaling   |
| <b>4. Autoimmunity with or without lymphoproliferation</b>                              |                |             |        |  |                                    |  |  |
| APECED (APS-1), autoimmune polyendocrinopathy with candidiasis and ectodermal dystrophy | <i>AIRE</i>    | AR or AD    | 240300 | Normal   | Normal                             | AIRE serves as check-point in the thymus for negative selection of autoreactive T cells and for generation of Tregs                                    | Autoimmunity; hypoparathyroidism, adrenal insufficiency, diabetes, gonadal dysfunction and other endocrine abnormalities; dental enamel hypoplasia, alopecia areata, enteropathy, pernicious anemia; chronic mucocutaneous candidiasis |
| ITCH deficiency   | <i>ITCH</i>    | AR          | 606409 | Not assessed   | Not assessed                       | Itch deficiency may cause immune dysregulation by affecting both anergy induction in auto-reactive effector T cells and generation of Tregs            | Early-onset chronic lung disease (interstitial pneumonitis), autoimmunity (thyroiditis, type I diabetes, chronic diarrhea/enteropathy, and hepatitis), failure to thrive, developmental delay, dysmorphic facial features              |
| Tripeptidyl-peptidase II deficiency   | <i>TPP2</i>    | AR          | 190470 | Decreased  | Decreased                          | TPP2 deficiency results in premature immunosenescence and immune dysregulation   | Variable lymphoproliferation, severe autoimmune cytopenias, hypergammaglobulinemia, recurrent infections   |
| JAK1 GOF  | <i>JAK1</i>    | AD GOF      | 147795 | Not assessed   | Not assessed                       | Hyperactive JAK1   | HSM, eosinophilia, eosinophilic enteritis, thyroid disease, poor growth, viral infections  |
| Polidase deficiency   | <i>PEPD</i>    | AR          | 613230 | Normal   | Nomal                              | Peptidase D  | Autoantibodies common, chronic skin ulcers, eczema, infections   |
| <b>5. Immune dysregulation with colitis</b>   |                |             |        |  |                                    |  |  |
| IL-10 deficiency  | <i>IL10</i>    | AR          | 124092 | Normal   | Normal                             | No functional IL-10 secretion  | Inflammatory bowel disease (IBD), folliculitis, recurrent respiratory diseases, arthritis, IBD, folliculitis, recurrent respiratory diseases, arthritis, lymphoma  |
| IL-10R deficiency   | <i>IL10RA</i>  | AR          | 146933 | Normal   | Normal                             | Leukocytes unresponsive to IL-10   | IBD, folliculitis, recurrent respiratory diseases, arthritis, lymphoma   |

**Table 4** (continued)

| Disease   | Genetic defect | Inheritance | OMIM   | Circulating T cells  | Circulating B cells              | Functional defect  | Associated features  |
|---|----------------|-------------|--------|--|----------------------------------|--|--|
|   | <i>IL10RB</i>  | AR          | 123889 | Normal   | Normal                           | Leukocytes unresponsive to IL-10, and IL-22, IL-26, IL-28A, IL-28B and IL-29                             |  |
| NFAT5 haploinsufficiency  | <i>NFAT5</i>   | AD          | 604708 | Normal   | Normal                           | Decreased memory B cells and plasmablasts  | IBD, recurrent sinopulmonary infections  |
| TGFB1 deficiency  | <i>TGFB1</i>   | AR          | 618213 | Normal   | Normal                           | Decreased T cell proliferation in response to anti-CD3   | IBD, immunodeficiency, recurrent viral infections, microcephaly, and encephalopathy  |
| RIPK1   | <i>RIPK1</i>   | AR          | 618108 | Reduced  | Normal/reduced                   | Reduced activation of MAPK, NFkB pathways  | Recurrent infections, early-onset IBD, progressive polyarthritis   |
| <b>6. Autoimmune lymphoproliferative syndrome (ALPS, Canale-Smith syndrome)</b> |                |             |        |  |                                  |  |  |
| ALPS-FAS  | <i>TNFRSF6</i> | AD<br>AR    | 134637 | Increased TCR $\alpha/\beta+$<br>CD4 CD8 double negative<br>(DN) T cells | Normal, low memory B cells       | Apoptosis defect FAS mediated  | Splenomegaly, adenopathies, autoimmune cytopenias, increased lymphoma risk, IgG and A normal or increased, elevated serum Fasl, IL-10, vitamin B12 |
| ALPS-FASLG  | <i>TNFSF6</i>  | AR          | 134638 | Increased DN T cells   | Normal                           | Apoptosis defect FASL mediated   | Splenomegaly, adenopathies, autoimmune cytopenias, SLE, soluble FasL is not elevated   |
| ALPS-Caspase10  | <i>CASP10</i>  | AD          | 601762 | Increased DN T cells   | Normal                           | Defective lymphocyte apoptosis   | Adenopathies, splenomegaly, autoimmunity   |
| ALPS-Caspase 8  | <i>CASP8</i>   | AR          | 601763 | Slightly increased DN T cells  | Normal                           | Defective lymphocyte apoptosis and activation  | Adenopathies, splenomegaly, bacterial and viral infections, hypogammaglobulinemia  |
| FADD deficiency   | <i>FADD</i>    | AR          | 602457 | Increased DN T cells   | Normal                           | Defective lymphocyte apoptosis   | Functional hypersplenism, bacterial and viral infections, recurrent episodes of encephalopathy and liver dysfunction                               |
| <b>7. Susceptibility to EBV and lymphoproliferative conditions</b>              |                |             |        |  |                                  |  |  |
| SAP deficiency (XLP1)   | <i>SH2D1A</i>  | XL          | 300490 | Normal or Increased activated T cells                                    | Reduced Memory B cells           | Reduced NK cell and CTL cytotoxic activity   | Clinical and immunologic features triggered by EBV infection: HLH, Lymphoproliferation, Aplastic anemia, Lymphoma.                                 |
| XIAP deficiency (XLP2)  | <i>XIAP</i>    | XL          | 300079 | Normal or Increased activated T cells; low/normal iNKT cells             | Normal or reduced Memory B cells | Increased T cells susceptibility to apoptosis to CD5 and enhanced activation-induced cell death (AICD)   | Hypogammaglobulinemia, Absent iNKT cells EBV infection, Splenomegaly, lymphoproliferation HLH, Colitis, IBD, hepatitis Low iNKT cells              |
| CD27 deficiency   | <i>CD27</i>    | AR          | 615122 | Normal   | No memory B cells                | hypogammaglobulinemia; poor Ab responses to some vaccines/infections                                     | Features triggered by EBV infection, HLH, aplastic anemia, low iNKT cells, B-lymphoma  |
| CD70 deficiency   | <i>CD70</i>    | AR          | 602840 | Normal number, low Treg, poor activation and function                    | Decreased memory B cells         | hypogammaglobulinemia; poor Ab responses to some vaccines/infections                                     | EBV susceptibility, Hodgkin lymphoma; autoimmunity in some patients  |
| CTPS1 deficiency  | <i>CTPS1</i>   | AR          | 615897 | Normal to low, but reduced activation, proliferation                     | Decreased memory B cells         | Normal/high IgG poor proliferation to antigen  | Recurrent/chronic bacterial and viral infections (EBV, VZV), EBV lymphoproliferation, B cell non-Hodgkin lymphoma                                  |
| CD137 deficiency (41BB)   | <i>TNFRSF9</i> | AR          | 602250 | Normal   | Normal                           | Low IgG, low IgA, poor responses to T cell-dependent and T cell independent chronic active EBV infection | EBV lymphoproliferation, B cell lymphoma,  |

**Table 4** (continued)

| Disease                                     | Genetic defect    | Inheritance | OMIM  | Circulating T cells                           | Circulating B cells  | Functional defect  | Associated features |
|---|-------------------|-------------|---|---|--|--|---------------------|
| RASGRP1 deficiency                          | <i>RASGRP1</i> AR | 603962      | Poor activation, proliferation, motility. Reduced naïve T cells   | Poor activation, proliferation, motility      | Normal IgM, IgG, increased IgA   | Recurrent pneumonia, herpesvirus infections, EBV associated lymphoma     |                     |
| RLTPR deficiency                            | <i>CARMIL2</i> AR | 610859      | Normal number, high CD4, increased naïve CD4 <sup>+</sup> and CD8 <sup>+</sup> T cells, low Treg and MAIT, poor CD28-induced function | Normal B cell numbers, reduced memory B cells | Normal to low, poor T dependent antibody response                              | Decreased NK cell function   |                     |
| X-linked magnesium EBV and neoplasia (XMen) | <i>MAGT1</i> XL   | 300853      | Low CD4 Low recent thymic emigrant cells, inverted CD4/CD8 ratio, reduced MAIT cells, poor proliferation to CD3                       | Normal but decreased memory B cells           | Progressive hypogammaglobulinemia  | EBV infection, lymphoma, viral infections, respiratory and GI infections |                     |
| PRKCD deficiency                            | <i>PRKCD</i> AR   | 615559      | Normal proliferation to CD3   | Low memory B cells, high CD5 B cells          | Reduced NK cell and CTL cytotoxic activity due to impaired expression of NKG2D | Glycosylation defects  |                     |

Total number of disorders in Table 4: 44

Total number of mutant genes in Table 4: 45

New disorders: 7; *SLC7A7* [72]; *IL2RB* [73, 74]; *DEF6* [48]; *FERMT1* [75]; *TGFBI* [76]; *RIPK1* [77, 78]; *TNFRSF9* [66, 79, 80]

*FHL* familial hemophagocytic lymphohistiocytosis, *HLH* hemophagocytic lymphohistiocytosis, *HSM* hepatosplenomegaly, *DN* double-negative, *SLE* systemic lupus erythematosus, *IBD* Inflammatory bowel disease

**Table 5** Congenital defects of phagocyte number or function

| Disease   | Genetic defect                                | Inheritance | OMIM                       | Affected cells      | Affected function   | Associated features   |

| <b>4. Other non-lymphoid defects</b><br>GATA2 deficiency  | <i>GATA2</i>  | AD  |             | 137295   | Monocytes + peripheral DC | Multi lineage cytopenias                                | Infections   |
| Pulmonary alveolar proteinosis  | <i>CSF2RA</i>   | XL (Biallelic mutations in pseudo-autosomal gene) |             | 300770   | Alveolar macrophages      | GM-CSF signaling  | Susceptibility to mycobacteria, HPV, histoplasmosis, alveolar proteinosis, MDS/AML/CMMI, lymphedema Alveolar proteinosis |
|   | <i>CSFR2B</i>   | AR  |             | 614370   |                           |   |  |

Total number of disorders in Table 5: 34

Total number of mutant genes in Table 5: 41

New disorders: 3; *SRP54* [81, 82]; *DNAJC21* [83]; *CYBC1* [84, 85]

Removed: Cyclic neutropenia was merged with elastase deficiency

MDS myelodysplastic syndrome, *IUGR* intrauterine growth retardation, *LAD* leukocyte adhesion deficiency, *AML* acute myelogenous leukemia, *CMMI* chronic myelomonocytic leukemia, *N* neutrophil, *M* monocyte, *MEL* melanocyte, *L* lymphocyte, *NK* natural killer

**Table 6** Defects in intrinsic and innate immunity

| Disease   | Disease        | Genetic defect | Inheritance | OMIM   | Affected cells   | Affected function  | Associated features |
|---|----------------|----------------|-------------|--|--|--|---------------------|
| <b>1. Mendelian susceptibility to mycobacterial disease (MSMD)</b>      |                |                |             |  |  |  |                     |
| IL-12 and IL-23 receptor β1 chain deficiency                            | <i>IL12RB1</i> | AR             | 601604      | L+NK   | IFN-γ secretion  | Susceptibility to mycobacteria and <i>Salmonella</i>                                 |                     |
| IL-12p40 (IL-12 and IL-23) deficiency                                   | <i>IL12B</i>   | AR             | 161561      | M  |  |  |                     |
| IL-12Rβ2 deficiency   | <i>IL12RB2</i> | AR             | 601642      | L+NK   |  |  |                     |
| IL-23R deficiency   | <i>IL23R</i>   | AR             | 607562      | L+NK   |  |  |                     |
| IFN-γ receptor 1 deficiency   | <i>IFNGRI</i>  | AR             | 209950      | M+L  | IFN-γ binding and signaling  |  |                     |
| IFN-γ receptor 2 deficiency   | <i>IFNGR2</i>  | AD             | 615978      | M+L  | IFN-γ signaling  |  |                     |
| STAT1 deficiency  | <i>STAT1</i>   | AD LOF         | 147569      | M+L  |  |  |                     |
| Macrophage gp91 phox deficiency   | <i>CYBB</i>    | XL             | 614892      | M+L  | Killing (faulty O <sub>2</sub> − production)   |  |                     |
| IRF8 deficiency   | <i>IRF8</i>    | AD             | 300645      | Macrophage only  | Impaired development of cDCs and Th1* cells  |  |                     |
|   |                | AR             | 614893      | M+L  | Lack of circulating monocytes and DCs, reduced NK cell numbers and function reported in some patients and Th1* cells |  |                     |
| SPPL2a deficiency   | <i>SPPL2A</i>  | AR             | 226990      | M  | Impaired development of cDCs and Th1* cells  |  |                     |
| Tyk2 deficiency   | <i>TYK2</i>    | AR             | 608238      | M+L  | Lack of functional ROR $\gamma$ T protein, IFN-γ production defect, complete absence of IL-17A/F-producing T cells   |  |                     |
| P1104A TYK2 homozygosity  | <i>TYK2</i>    | AR             | 611521      | M+L  | Reduced cellular responses to IL-10, IL-12, IL-23, and type I IFNs   |  |                     |
| ISG15 deficiency  | <i>ISG15</i>   | AR             | 176941      | L  | Impaired cellular responses to IL-23   |  |                     |
| ROR $\gamma$ T deficiency   | <i>RORC</i>    | AR             | 147571      |  | IFN-γ production defect  |  |                     |
| JAK1 deficiency   | <i>JAK1</i>    | AR LOF         | 602943      | L+NK   | Lack of functional ROR $\gamma$ T protein, IFN-γ production defect, complete absence of IL-17A/F-producing T cells   |  |                     |
|   |                | AR             | 147795      | N+L  | Reduced JAK1 activation to cytokines, Reduced IFN-γ production   |  |                     |
| <b>2. Epidermolyticus verruciformis (HPV)</b>                           |                |                |             |  |  |  |                     |
| EVER1 deficiency  | <i>TMC6</i>    | AR             | 605828      | Keratinocytes  | EVER1, EVER2 and CIB1 form a complex in keratinocytes  | Human papillomavirus (HPV) (group B1) infections and cancer of the skin (typical EV) |                     |
| EVER2 deficiency  | <i>TMC8</i>    |                | 605829      |  |  |  |                     |
| CIB1 deficiency   | <i>CIB1</i>    |                | 618267      |  |  | Warts (HPV) infection, neutropenia, low B cell number, hypogammaglobulinemia         |                     |
| WHIM (warts, hypogammaglobulinemia, infections, myelokathexis) syndrome | <i>CXCR4</i>   | AD GOF         | 162643      | Leukocytes   | Increased response of the CXCR4 chemokine receptor to its ligand CXCL12 (SDF-1)                                      |  |                     |
| <b>3. Predisposition to severe viral infection</b>                      |                |                |             |  |  |  |                     |
| STAT1 deficiency  | <i>STAT1</i>   | AR LOF         | 600555      | Leukocytes and other cells                                       | STAT1-dependent IFN-α/β, γ and λ responses   | Severe viral infections, mycobacterial infection                                     |                     |
| STAT2 deficiency  | <i>STAT2</i>   | AR             | 600556      | Leukocytes and other cells                                       | STAT2-dependent IFN-α/β and λ response   | Severe viral infections (disseminated virus-strain measles)                          |                     |
| IRF9 deficiency   | <i>IRF9</i>    | AR             | 147574*     | Leukocytes and other cells                                       | IFN-β and ISGF3-dependent IFN-α/β and λ responses  | Severe influenza disease   |                     |
| IRF7 deficiency   | <i>IRF7</i>    | AR             | 605047      | Leukocytes, plasmacytoid dendrite cells, non-hematopoietic cells | IFN-α, β and γ production and IFN-λ production   |  |                     |
| IFNAR1 deficiency   | <i>IFNAR1</i>  | AR             | 107450*     | Leukocytes and other cells                                       | IFNAR1-dependent IFN-α, β and γ production   | Severe disease caused by Yellow Fever vaccine and Measles vaccine                    |                     |
| IFNAR2 deficiency   | <i>IFNAR2</i>  | AR             | 602376      | Broadly expressed  | IFNAR2-dependent IFN-α/β responses to IFN-α/β  | Severe viral infections (disseminated virus-strain measles, HHV6)                    |                     |

**Table 6** (continued)

| Disease  |   | Genetic defect | Inheritance                | OMIM  | Affected cells  | Affected function   | Associated features  |
|--|---|----------------|----------------------------|---|---|---|--|
| CD16 deficiency  | <i>FCGR3A</i>                                   | AR             | 146740                     | NK cells  |   | Altered NK cells function   | Severe herpes viral infections, particularly VZV, Epstein-Barr virus (EBV), and (HPV)<br>Rhinovirus and other RNA viruses  |
| MDA5 deficiency  | <i>IFIH1</i>                                    | AR LOF         | 606951                     | Broadly expressed   | Viral recognition and IFN induction   | Impaired viral recognition and IFN induction in response to VZV or poly I:C | Severe VZV infection   |
| RNA polymerase III deficiency  | <i>POLR3A</i><br><i>POLR3C</i><br><i>POLR3F</i> | AD<br>AD<br>AD | 614258<br>617454<br>617455 | Leukocytes and other cells                                  |   |   | Herpes simplex virus 1 encephalitis (incomplete clinical penetrance for all etiologies listed here); severe pulmonary influenza; VZV Herpes simplex virus 1 encephalitis |
| <b>4. Herpes simplex encephalitis (HSE)</b>                              | <i>TLR3</i>                                     | AD<br>AR       | 613002                     | Central nervous system (CNS) resident cells and fibroblasts | TLR3-dependent IFN- $\alpha$ , $\beta$ and $\gamma$ response                                  |   |  |
| UNC93B1 deficiency   | <i>UNC93B1</i>                                  | AR             | 608204                     |   | UNC-93B-dependent IFN- $\alpha$ , $\beta$ and $\gamma$ response                               |   |  |
| TRAF3 deficiency   | <i>TRAF3</i>                                    | AD             | 601896                     |   | TRAF3-dependent IFN- $\alpha$ , $\beta$ and $\gamma$ response                                 |   |  |
| TRIF deficiency  | <i>TICAM1</i>                                   | AD             | 607601                     |   | TRIF-dependent IFN- $\alpha$ , $\beta$ and $\gamma$ response                                  |   |  |
| TBK1 deficiency  | <i>TBK1</i>                                     | AR<br>AD       | 604834                     |   | TBK1-dependent IFN- $\alpha$ , $\beta$ and $\gamma$ response                                  |   |  |
| IRF3 deficiency  | <i>IRF3</i>                                     | AD             | 616532                     |   | Low IFN- $\alpha$ / $\beta$ production in response to HSV1 and decreased IRF3 phosphorylation |   |  |
| DBR1 deficiency  | <i>DBR1</i>                                     | AR             | 607024                     |   | Impaired production of anti-viral IFNs  |   | HSE of the brainstem. Other viral infections of the brainstem.   |
| <b>5. Predisposition to invasive fungal diseases</b>                     | <i>CARD9</i>                                    | AR             | 607212                     | Mononuclear phagocytes                                      | CARD9 signaling pathway   |   | Invasive candidiasis infection, deep dermatophytes, other invasive fungal infections   |
| <b>6. Predisposition to mucocutaneous candidiasis</b>                    | <i>IL17RA</i>                                   | AR             | 605461                     | Epithelial cells, fibroblasts, mononuclear phagocytes       | IL-17RA signaling pathway   |   | CMC, folliculitis  |
| IL-17RA deficiency   | <i>IL17RC</i>                                   | AR             | 610925                     | T cells   | IL-17RC signaling pathway   |   | CMC  |
| IL-17RC deficiency   | <i>IL17F</i>                                    | AD             | 606496                     | T cells, B cells, monocytes                                 | IL-17F-containing dimers  |   | CMC, folliculitis  |
| IL-17F deficiency  | <i>STAT1</i>                                    | AD GOF         | 600555                     |   | Gain-of-function STAT1 mutations that impair the development of IL-17-producing T cells       |   | CMC, various fungal, bacterial and viral (HSV) infections, auto-immunity (thyroiditis, diabetes, cytopenias), enteropathy  |
| STAT1 GOF  |   |                |                            |   | Fibroblasts fail to respond to IL-17A and IL-17F, and their T cells to IL-17E                 |   | CMC, blepharitis, folliculitis, and macroglossia   |
| ACT1 deficiency  | <i>TRAF3IP2</i>                                 | AR             | 607043                     | T cells, fibroblasts  |   |   |  |
| <b>7. TLR signaling pathway deficiency with bacterial susceptibility</b> | <i>IRAK4</i>                                    | AR             | 606883                     | Lymphocytes + granulocytes+ monocytes                       | TIR-IRAK4 signaling pathway   |   | Bacterial infections (pyogens)   |
| IRAK4 deficiency   | <i>MYD88</i>                                    | AR             | 602170                     | Lymphocytes + granulocytes + monocytes                      | TIR-MYD88 signaling pathway   |   |  |

**Table 6** (continued)

| Disease  |                 | Genetic defect | Inheritance | OMIM   | Affected cells                         | Affected function   | Associated features   |
|--|-----------------|----------------|-------------|--------|--|---|---|
| IRAK1 deficiency   | <i>IRAK1</i>    | XL             |             | 300283 | Lymphocytes + granulocytes + monocytes | TIR-IRAK1 signaling pathway   | Bacterial infections, X-linked MECP2 deficiency-related syndrome due to a large de novo Xq28 chromosomal deletion encompassing both <i>MECP2</i> and <i>IRAK1</i> |
| TIRAP deficiency   | <i>TIRAP</i>    | AR             |             | 614382 | Lymphocytes + granulocytes + monocytes | TIRAP- signaling pathway, TLR1/2, TLR2/6, and TLR4 agonists were impaired in the fibroblasts and leukocytes | Staphylococcal disease during childhood   |
| <b>8. Other inborn errors of immunity related to non-hematopoietic tissues</b> |                 |                |             |        |  |   |   |
| Isolated congenital asplenia (ICA)   | <i>RPSA</i>     | AD             |             | 271400 | No spleen                              | RPSA encodes ribosomal protein SA, a component of the small subunit of the ribosome                         | Bacteremia (encapsulated bacteria)  |
|  | <i>HMOX</i>     | AR             |             | 141250 | Macrophages                            | HO-1 regulates iron recycling and heme-dependent damage occurs  | Hemolysis, nephritis, inflammation  |
| Trypanosomiasis  | <i>APOL1</i>    | AD             |             | 603743 | Somatic                                | Pore forming serum protein  | Trypanosomiasis   |
| Acute liver failure due to NBAS deficiency                                     | <i>NBAS</i>     | AR             |             | 608025 | Somatic and hematopoietic              | ER stress   | Fever induces liver failure   |
| Acute necrotizing encephalopathy   | <i>RANBP2</i>   | AR             |             | 601181 | Ubiquitous expression                  | Nuclear pore  | Fever induces acute encephalopathy  |
| Osteopetrosis  | <i>CLCN7</i>    | AR             |             | 602727 | Osteoclasts                            | Secretory lysosomes   | Osteopetrosis with hypocalcemia, neurologic features  |
|  | <i>SNX10</i>    | AR             |             | 614780 |  |   | Osteopetrosis with visual impairment  |
|  | <i>OSTM1</i>    | AR             |             | 607649 |  |   | Osteopetrosis with hypocalcemia, neurologic features  |
|  | <i>PLEKHM1</i>  | AR             |             | 611466 |  |   | Osteopetrosis   |
|  | <i>TCIRG1</i>   | AR             |             | 604592 |  |   | Osteopetrosis with hypocalcemia   |
|  | <i>TNFSF11A</i> | AR             |             | 603499 |  |   | Osteopetrosis   |
|  | <i>TNFSF11</i>  | AR             |             | 602642 |  |   | Osteopetrosis   |
| Hidradenitis suppurativa   | <i>NCSTN</i>    | AD             |             | 605254 | Epidermis                              | Osteoclastogenesis  | Osteopetrosis with severe growth retardation  |
|  | <i>PSEN1</i>    | AD             |             | 613737 |  | Osteoclastogenesis  |   |
|  | <i>PSENEN</i>   | AD             |             | 613736 |  | Notch signaling/gamma-secretase in hair follicle regulates keratinization                                   | Vernier's disease/Hidradenitis suppurativa with acne  |
|  | <i>IRF4</i>     | AD             |             | 601900 | L+M                                    |   | Vernier's disease/Hidradenitis suppurativa with cutaneous hyperpigmentation   |
| 9. Other inborn errors of immunity related to leukocytes                       |                 |                |             |        |  |   | Vernier's disease/Hidradenitis suppurativa  |
| IRF4 haploinsufficiency  | <i>IRF4</i>     | AD             |             | 604113 | Leukocytes and other cells             | IRF4 is a pleiotropic transcription factor  | Whipple's disease   |
| IL-18BP deficiency   | <i>IL18BP</i>   | AR             |             |        |  | IL-18BP neutralizes secreted IL-18  | Fulminant viral hepatitis   |

Total number of disorders in Table 6: 53

Total number of mutant genes in Table 6: 64

New genes: 13, *IL12RB2* [51]; *IL23R* [51]; *SPPL2A* [52]; *TYK2 P1104A allele* [10]; *CIB1* [86]; *IRF9* [46]; *IFNARI* [87]; *POLR3A* [88]; *POLR3C* [88]; *POLR3F* [89]; *DBR1* [90]; *IRF4* [91]; *IL18BP* [47]  
*NF-κB* nuclear factor kappa B, *TIR* Toll and Interleukin 1 receptor, *IFN* interferon, *TLR* Toll-like receptor, *MDC* myeloid dendritic cell, *CNS* central nervous system, *CMC* chronic mucocutaneous candidiasis, *HPV* human papillomavirus, *VZV* varicella zoster virus, *EBV*, Epstein-Barr virus

**Table 7** Autoinflammatory disorders

| Disease  | Genetic defect      | Inheritance | OMIM         | T cells      | B cells | Functional defect  | Associated features   |
|--|---------------------|-------------|--------------|--------------|---------|--|---|
| <b>1. Type I interferonopathies</b>                                |                     |             |              |              |         |  |   |
| STING-associated vasculopathy, infantile-onset (SAVI)              | <i>TMEM173</i> AR   | 612374      | Not assessed | Not assessed |         | STING activates both the NF-kappa-B and IRF3 transcription pathways to induce expression of IFN                                  | Skin vasculopathy, inflammatory lung disease, systemic autoinflammation and ICC, FCL  |
| ADA2 deficiency  | <i>ADA2</i> AR      | 607575      | Not assessed | Not assessed |         | ADAs deactivate extracellular adenosine and terminate adenosine signaling through adenosine receptors                            | Polyarteritis nodosa, childhood-onset, early-onset recurrent ischemic stroke and fever; some patients develop hypogammaglobulinemia               |
| TREX1 deficiency, Aicardi-Goutières syndrome 1 (AGS1)              | <i>TREX1</i> AR     | 606609      | Not assessed | Not assessed |         | Intracellular accumulation of abnormal ss DNA species leading to increased type I IFN production                                 | Classical AGS, SLE, FCL   |
| RNAseH2B deficiency, AGS2  | <i>RNAseH2B</i> AR  | 610326      | Not assessed |              |         | Intracellular accumulation of abnormal RNA-DNA hybrid species leading to increased type I IFN production                         | Classical AGS, SP   |
| RNAseH2C deficiency, AGS3  | <i>RNAseH2C</i> AR  | 610330      | Not assessed |              |         | Controls dNTPs in the cytosol, failure of which leads to increased type I IFN production   | Classical AGS   |
| RNAseH2A deficiency, AGS4  | <i>RNAseH2A</i> AR  | 606034      | Not assessed |              |         | Catalyzes the deamination of adenosine to inosine in dsRNA substrates, failure of which leads to increased type I IFN production | Classical AGS, FCL  |
| SAMHD1 deficiency, AGS5  | <i>SAMHD1</i> AR    | 606754      | Not assessed |              |         | IFIH1 gene encodes a cytoplasmic viral RNA receptor that activates type I interferon signaling through the MAVS adaptor molecule | Classical AGS, BSN, SP  |
| ADARI deficiency, AGS6   | <i>ADARI</i> AR     | 146920      | Not assessed | Not assessed |         | DNAse II degrades and eliminates DNA. Loss of DNase II activity induces type I interferon signaling                              | Classical AGS, SLE, SP, SMS   |
| Aicardi-Goutières syndrome 7 (AGS7)                                | <i>IFIH1</i> AD GOF | 615846      | Not assessed | Not assessed |         | DNAse II is an endonuclease that degrades extracellular DNA. DNASEIIL3 deficiency decreases clearance of apoptotic cells         | Very early onset SLE, reduced complement levels, autoantibodies (dsDNA, ANCA), lupus nephritis, hypocomplementemic urticarial vasculitis syndrome |
| DNAse II deficiency  | <i>DNASE2</i> AR    | 126350      | Not assessed | Not assessed |         | Upregulation of IFN through mechanism possibly relating to pDCS  | Short stature, SP, ICC, SLE, thrombocytopenia and autoimmune hemolytic anemia, possibly recurrent bacterial and viral infections                  |
| Pediatric systemic lupus erythematosus due to DNASEIIL3 deficiency | <i>DNASEIIL3</i> AR | 614420      |              |              |         |  | Hypopigmentation, characteristic facies, lung and GI involvement  |
| Spondyloenchondro-dysplasia with immune dysregulation (SPEND)      | <i>ACPS</i> AR      | 171640      | Not assessed | Not assessed |         |  |   |
| X-linked reticulate pigmentary disorder                            | <i>POLA1</i> XL     | 301220      | Not assessed | Not assessed |         |  |   |

**Table 7** (continued)

| Disease  | Genetic defect | Inheritance      | OMIM             | T cells  | B cells   | Functional defect   | Associated features                       |
|--|----------------|------------------|------------------|--|---|---|---|
| USP18 deficiency   | <i>USP18</i>   | AR               | 607057           | Not assessed                                       | Not assessed  | Defective negative regulation of ISG15 leading to increased IFN   | TORCH-like syndrome                       |
| OAS1 deficiency  | <i>OASI</i>    | AD GOF           | 164350           | Low  |   | Increased interferon from recognition of RNA  | Pulmonary alveolar proteinosis, skin rash |
| <b>2. Defects affecting the inflammasome</b>   |                |                  |                  |  |   |   |   |
| Familial Mediterranean fever   | <i>MEFV</i>    | AR LOF           | 249100           | Mature granulocytes, cytokine-activated monocytes. | Increased inflammasome-mediated induction of IL1 $\beta$ .  | Recurrent fever, serositis and inflammation responsive to colchicine. Predisposes to vasculitis and inflammatory bowel disease. |   |
|  |                | AD               | 134610           | Mature granulocytes, cytokine-activated monocytes. | Usually M694del variant.  |   |   |
| Mevalonate kinase deficiency (Hyper IgD syndrome)  | <i>MVK</i>     | AR               | 260920           | Somatic and hematopoietic                          | affecting cholesterol synthesis, pathogenesis of disease unclear  | Periodic fever and leukocytosis with high IgD levels  |   |
| Muckle-Wells syndrome  | <i>NLRP3</i>   | AD GOF<br>AD GOF | 191900<br>120100 | PMNs Monocytes<br>PMNs, monocytes                  | Defect in cryopyrin, involved in leukocyte apoptosis and NFKB signaling and IL-1 processing   | Urticaria, SNHL, amyloidosis.   |   |
| Familial cold autoinflammatory syndrome 1  |                | AD GOF           | 607115           | PMNs, chondrocytes                                 |   | Non-pruritic urticaria, arthritis, chills, fever and leukocytosis after cold exposure.  |   |
| Neonatal onset multisystem inflammatory disease (NOMID) or chronic infantile neurologic cutaneous and articular syndrome (CINCA) | <i>NLRP12</i>  | AD GOF           | 611762           | PMNs, monocytes                                    |   | Neonatal onset rash, chronic meningitis, and arthropathy with fever and inflammation.   |   |
| Familial cold autoinflammatory syndrome 2  |                | AD GOF           | 616050           | PMNs monocytes macrophages                         |   | Non-pruritic urticaria, arthritis, chills, fever and leukocytosis after cold exposure.  |   |
| NLRP4-MAS (macrophage activating syndrome)   | <i>NLRP4</i>   | AD GOF           | 616115           | B cells, NK, Mast cells                            | Gain of function mutation in <i>NLRP4</i> results in elevated secretion of IL-1 $\beta$ and IL-18 as well as macrophage activation pathways | Severe enterocolitis and macrophage activation syndrome   |   |
| Familial cold autoinflammatory syndrome 4  | <i>PLCG2</i>   | AD GOF           | 614878           | B cells, NK, Mast cells                            | Mutations activate IL-1 pathways  | Cold urticaria hypogammaglobulinemia, impaired humoral immunity, autoinflammation   |   |
| PLAID (PLC $\gamma$ 2 associated antibody deficiency and immune dysregulation)   |                |                  | 614468           |  |   |   |   |
| Familial cold autoinflammatory syndrome 3 or PLAID (c2120A > C)  |                |                  |                  |  |   |   |   |
| NLRP1 deficiency   | <i>NLRP1</i>   | AR               | 617388           | leukocytes   | Systemic elevation of IL-18 and caspase 1, suggesting involvement of NLRP1 inflammasome   | Dyskeratosis, autoimmunity and arthritis  |   |
| NLRP1 GOF  | <i>NLRP1</i>   | AD GOF           | 615225           | Keratinocytes                                      | Increased IL1 $\beta$   | Palmoplantar carcinoma, corneal scarring, recurrent respiratory papillomatosis  |   |

**Table 7** (continued)

| Disease  | Genetic defect          | Inheritance | OMIM  | T cells   | B cells   | Functional defect                     | Associated features |
|--|-------------------------|-------------|---|---|---|---------------------------------------|---------------------|
| <b>3. Non-inflammasome-related conditions</b>  |                         |             |   |   |   |                                       |                     |
| TNF receptor-associated periodic syndrome (TRAPS)  | <i>TNFSF1A</i> AD       | 142680      | PMNs, monocytes   | Mutations of 55-kD TNF receptor leading to intracellular receptor retention or diminished soluble cytokine receptor available to bind TNF | Recurrent fever, serositis, rash, and ocular or joint inflammation  |                                       |                     |
| Pyogenic sterile arthritis, pyoderma gangrenosum, acne (PAPA) syndrome, hyperzincemia and hypercalciphilic neutropenia | <i>PSTPIP1</i> AD       | 604416      | Hematopoietic tissues, upregulated in activated T cells | Disordered actin reorganization leading to compromised physiologic signaling during inflammatory response                                 | Destructive arthritis, inflammatory skin rash, myositis   |                                       |                     |
| Blau syndrome  | <i>NOD2</i> AD          | 186580      | Monocytes   | Mutations in nucleotide binding site of CARD15, possibly disrupting interactions with lipopolysaccharides and NF-κB signaling             | Uveitis, granulomatous synovitis, camptodactyly, rash and cranial neuropathies, 30% develop Crohn colitis           | Early onset diarrhea and skin lesions |                     |
| ADAM17 deficiency  | <i>ADAM17</i> AR        | 614328      | Leukocytes and epithelial cells                         | Defective TNFα production   | Chronic recurrent multifocal osteomyelitis, transfusion-dependent disorders   |                                       |                     |
| Chronic recurrent multifocal osteomyelitis and congenital dyserythropoietic anemia (Majed syndrome)                    | <i>LPIN2</i> AR         | 609628      | Neutrophils, bone marrow cells                          | Undefined   | Neonatal onset of sterile multifocal osteomyelitis, periostitis and pustulosis.                                     |                                       |                     |
| DIRA (Deficiency of the Interleukin 1 Receptor Antagonist)   | <i>IL1RN</i> AR         | 612852      | PMNs, Monocytes   | Mutations in the IL1 receptor antagonist allow unopposed action of Interleukin 1  | Pustular psoriasis  |                                       |                     |
| DITRA (Deficiency of IL-36 receptor antagonist)  | <i>IL36RN</i> AR        | 614204      | Keratinocytes, leukocytes                               | Mutations in IL-36RN leads to increase IL-8 production  | Hyperpigmentation hypertrichosis, histiocytosis-lymphadenopathy plus syndrome                                       |                                       |                     |
| SLC29A3 mutation   | <i>SLC29A3</i> AR       | 602782      | Leukocytes, bone cells                                  | —   | Psoriasis   |                                       |                     |
| CAMPS (CARD14 mediated psoriasis)  | <i>CARD14</i> AD        | 602723      | Mainly in keratinocytes                                 | Mutations in CARD14 activate the NF-κB pathway and production of IL-8   | Bone degeneration in jaws   |                                       |                     |
| Cherubism  | <i>SH3BP2</i> AD        | 118400      | Stroma cells, bone cells                                | Hyperactivated macrophage and increase NF-κB  |   |                                       |                     |
| CANDLE (chronic atypical neutrophilic dermatitis with lipodystrophy)   | <i>PSMB8*</i> AR and AD | 256040      | Keratinocytes, B cell adipose cells                     | Mutations cause increased IFN signaling through an undefined mechanism  | Panniculitis, lipodystrophy, autoimmune hemolytic anemia  |                                       |                     |
| COPA defect  | <i>COPA</i> AD          | 6011924     | PMN and tissue specific cells                           | Defective intracellular transport via the coat protein complex I (COP1)   | Autoimmune inflammatory arthritis and interstitial lung disease with Th17 dysregulation and autoantibody production |                                       |                     |
| Oulipenia/ORAS   | <i>OTULIN</i> AR        | 615712      | Leukocytes  | Increase LUBAC induction of NF-κB activation leading to high proinflammatory cytokines levels.  | Fever, diarrhea, dermatitis   |                                       |                     |

**Table 7** (continued)

| Disease  | Genetic defect | Inheritance | OMIM   | T cells                                  | B cells   | Functional defect   | Associated features |
|--|----------------|-------------|--------|--|---|---|---------------------|
| A20 deficiency   | <i>TNFAIP3</i> | AD          | 616744 | Lymphocytes                              | Defective inhibition of NF-KB signaling pathway                       | Arthralgia, mucosal ulcers, ocular inflammation                               |                     |
| AP1S3 deficiency   | <i>AP1S3</i>   | AR          | 615781 | Keratinocytes                            | Disrupted TLR3 translocation  | Pustular psoriasis  |                     |
| ALPI deficiency  | <i>ALPI</i>    | AR          | 171740 | Intestinal epithelial cells              | Deficient inhibition of LPS in intestine                              | Inflammatory bowel disease  |                     |
| TRIM22   | <i>TRIM22</i>  | AR          | 606359 | Macrophages, intestinal epithelial cells | Granulomatous colitis   | Inflammatory bowel disease  |                     |
| T cell lymphoma subcutaneous panniculitis-like (TIM3 deficiency) | <i>HAVCR2</i>  | AR          | 618398 | Leukocytes                               | Increased inflammasome activity due to defective checkpoint signaling | Panniculitis, HLH, polyclonal cutaneous T cell infiltrates or T cell lymphoma |                     |

Total number of disorders in Table 7: 45

Total number of mutant genes in Table 7: 42

New disorders: 9; *DNASE2* [93]; *DNASE/L3* [94–96]; *OASI* [97]; AD *MEFY*; *NLRP1 GOF* [98, 99]; *ALPI* [100]; *TRIM22* [101]; *PSMG2* [102]; *HAVCR2* [103, 104]

*IFN* interferon, *HSM* hepatosplenomegaly, *CSF* cerebrospinal fluid, *SLE* systemic lupus erythematosus, *TORCH* toxoplasmosis, other, rubella, cytomegalovirus, and herpes infections, *SNHL* sensorineural hearing loss, *AGS* Aicardi-Goutières syndrome, *BSN* bilateral striatal necrosis, *FCL* familial chilblain lupus, *ICC* intracranial calcification, *pDCs* plasmacytoid dendritic cells, *SP* spastic paraparesis, *SMS* Singleton-Merten syndrome, *ss* single-stranded DNA

\*Variants in *PSMB4*, *PSMB9*, *PSMA3*, and *POMP* have been proposed to cause a similar CANDLE phenotype in compound heterozygous monogenic (*PSMB4*), digenic (*PSMA3/PSMB8*, *PSMB9/PSMB4*, *PSMB4/PSMB8*) and AD monogenic (*POMP*) models [92]

**Table 8** Complement deficiencies

| Disease                       |  | Genetic defect | Inheritance    | Gene OMIM                  | Laboratory features   | Associated features   |
|-------------------------------|--|----------------|----------------|----------------------------|---|---|

| C1r deficiency                | <i>C1R</i>   | AR             | AR             | 613785                     | Absent CH50 hemolytic activity, defective activation of the classical pathway   | SLE, infections with encapsulated organisms, Ehlers-Danlos phenotype  |
| C1r Periodontal Ehlers-Danlos | <i>C1R</i>   | AD GOF         | AD GOF         | 613785                     | Normal CH50   | Hyperpigmentation, skin fragility   |
| C1s deficiency                | <i>C1S</i>   | AR             | AR             | 613785                     | Absent CH50 hemolytic activity, defective activation of the classical pathway   | SLE, infections with encapsulated organisms, Ehlers-Danlos phenotype  |
| C1s Periodontal Ehlers-Danlos | <i>C1S</i><br><i>C4A + C4B</i>   | AD GOF<br>AR   | AD GOF<br>AR   | 613785<br>120810           | Normal CH50   | Hyperpigmentation, skin fragility   |
| Complete C4 deficiency        |  |                |                |                            | Absent CH50 hemolytic activity, defective activation of the classical pathway, complete deficiency requires biallelic mutations/deletions/conversions of both C4A and C4B                   | SLE, infections with encapsulated organisms, partial deficiency is common (either C4A or C4B) and appears to have a modest effect on host defense |
| C2 deficiency                 | <i>C2</i>  | AR             | AR             | 217000                     | Absent CH50 hemolytic activity, defective activation of the classical pathway   | SLE, infections with encapsulated organisms, atherosclerosis  |
| C3 deficiency (LOF)           | <i>C3</i>  | AR             | AR             | 120700                     | Absent CH50 and AH50 hemolytic activity, defective opsonization, defective humoral immune response  | Infections, glomerulonephritis, atypical hemolytic-uremic syndrome with GOF mutations.  |
| C3 GOF                        | <i>C3</i>  | AD GOF         | AD GOF         | 120700                     | Increased activation of complement  | Atypical hemolytic-uremic syndrome  |
| C5 deficiency                 | <i>C5</i>  | AR             | AR             | 120900                     | Absent CH50 and AH50 hemolytic activity   | Disseminated neisserial infections  |
| C6 deficiency                 | <i>C6</i>  | AR             | AR             | 217050                     | Defective bactericidal activity   |   |
| C7 deficiency                 | <i>C7</i>  | AR             | AR             | 217070                     | Absent CH50 and AH50 hemolytic activity, defective bactericidal activity  |   |
| C8 $\alpha$ deficiency        | <i>C8A</i>   | AR             | AR             | 120950                     |   |   |
| C8 $\gamma$ deficiency        | <i>C8G</i>   | AR             | AR             | 120930                     |   |   |
| C8 $\beta$ deficiency         | <i>C8B</i>   | AR             | AR             | 120960                     |   |   |
| C9 deficiency                 | <i>C9</i>  | AR             | AR             | 120940                     | Reduced CH50 and AP50 hemolytic activity, deficient bactericidal activity   | Mild susceptibility to disseminated neisserial infections   |
| MASP2 deficiency              | <i>MASP2</i>   | AR             | AR             | 605102                     | Deficient activation of the lectin pathway  | Pyogenic infections, inflammatory lung disease, autoimmunity  |
| Ficolin 3 deficiency          | <i>FCN3</i>  | AR             | AR             | 604973                     | Absence of complement activation by the Ficolin 3 pathway   | Respiratory infections, abscesses   |
| C1 inhibitor deficiency       | <i>SERPING1</i>  | AD             | AD             | 606860                     | Spontaneous activation of the complement pathway with consumption of C4/C2, spontaneous activation of the contact system with generation of bradykinin from high molecular weight kininogen | Hereditary angioedema   |
| Factor B GOF                  | <i>CFB</i>   | AD GOF         | AD GOF         | 612924                     | Gain-of-function mutation with increased spontaneous AH50   | Atypical hemolytic-uremic syndrome  |
| Factor B deficiency           | <i>CFB</i>   | AR             | AR             | 615561                     | Deficient activation of the alternative pathway   | Infections with encapsulated organisms  |

**Table 8** (continued)

| Disease   |  | Genetic defect | Inheritance  | Gene OMIM  | Laboratory features  | Associated features  |
|---|--|----------------|--|--|--|--|
| Factor D deficiency                                 | <i>CFD</i>   | AR             | 134350   | Absent AH50 hemolytic activity   |  | Neisserial infections  |
| Properdin deficiency                                | <i>CFP</i>   | XL             | 300383   | Absent AH50 hemolytic activity   |  | Neisserial infections  |
| Factor I deficiency                                 | <i>CFI</i>   | AR             | 217030   | Spontaneous activation of the alternative complement pathway with consumption of C3  |  | Infections, disseminated neisserial infections, atypical Hemolytic-uremic syndrome, preeclampsia |
| Factor H deficiency                                 | <i>CFH</i>   | AR or AD       | 134370   | Spontaneous activation of the alternative complement pathway with consumption of C3  |  |  |
| Factor H-related protein deficiencies               | <i>CFHR1</i><br><i>CFHR2</i><br><i>CFHR3</i><br><i>CFHR4</i><br><i>CFHR5</i> | AR or AD       | 134371,<br>600889,<br>605336,<br>605337,<br>608593 | Normal CH50, autoantibodies to Factor H, linked deletions of one or more CFHR genes leads to susceptibility autoantibody-mediated aHUS | Older onset atypical hemolytic-uremic syndrome, disseminated neisserial infections |  |
| Thrombomodulin deficiency                           | <i>THBD</i>  | AD             | 188040   | Normal CH50, AH50  |  | Atypical hemolytic-uremic syndrome   |
| Membrane Cofactor Protein (CD46) deficiency         | <i>CD46</i>  | AD             | 120920   | Inhibitor of complement alternate pathway, decreased C3b binding   |  | Atypical hemolytic-uremic syndrome, infections, preeclampsia                                     |
| Membrane Attack Complex Inhibitor (CD59) deficiency | <i>CD59</i>  | AR             | 107271   | Erythrocytes highly susceptible to complement-mediated lysis   |  | Hemolytic anemia, polyneuropathy   |
| CD55 deficiency (CHAPLE disease)                    | <i>CD55</i>  | AR             | 125240   | Hyperactivation of complement on endothelium   |  | Protein losing enteropathy, thrombosis   |

Total number of disorders in Table 8: 30

Total number of mutant genes in Table 8: 36

New disorders: 2; *C1S* AD GOF [105], *C1R* AD GOF [105]*MAC* membrane attack complex, *SLE* systemic lupus erythematosus

**Table 9** Bone marrow failure

| Disease  | Genetic defect | Inheritance | Gene OMIM | T cells       | B cells       | Other affected cells | Associated features  | Major Category                             | Subcategory            |
|--|----------------|-------------|-----------|---------------|---------------|----------------------|--|--|------------------------|
| Fanconi anemia type A  | <i>FANCA</i>   | AR          | 227650    | Normal to low | HSC           |                      | Normal to low NK, CNS, skeletal, skin, cardiac, GI, urogenital anomalies, increased chromosomal breakage   | Bone marrow failure with immune deficiency | Fanconi Anemia         |
| Fanconi anemia type B  | <i>FANCB</i>   | XLR         | 300514    |               |               |                      |  |  |                        |
| Fanconi anemia type C  | <i>FANCC</i>   | AR          | 227645    |               |               |                      |  |  |                        |
| Fanconi anemia type D1   | <i>BRCA2</i>   | AR          | 605724    |               |               |                      |  |  |                        |
| Fanconi anemia type D2   | <i>FANCD2</i>  | AR          | 227646    |               |               |                      |  |  |                        |

Total number of disorders in Table 9: 43

Total number of mutant genes in Table 9: 43

*HSC* hematopoietic stem cell, *NK* natural killer, *CNS* central nervous system, *GI* gastrointestinal, *MDS* myelodysplastic syndrome, *DKCX* X-linked dyskeratosis congenital, *DKCA* autosomal dominant dyskeratosis congenita, *DKCB* autosomal recessive dyskeratosis congenita, *BMFS* bone marrow failure syndrome

**Table 10** Phenocopies of inborn errors of immunity

| Disease  | Genetic defect/presumed pathogenesis    | Circulating T cells   | Circulating B cells                          | Serum Ig            | Associated features/similar PID  |
|--|---|---|--|---------------------|--|
| <b>Associated with somatic mutations</b>                             |   |   |  |                     |  |
| Autoimmune lymphoproliferative syndrome (ALPS–SFAS)                  | Somatic mutation in <i>TNFRSF6</i>      | Increased CD4–CD8– double negative (DN) $\alpha\beta$ T cells | Normal, but increased number of CD2+ B cells | Normal or increased | Splenomegaly, lymphadenopathy, autoimmune cytopenias, Defective lymphocyte apoptosis/ALPS–FAS (=ALPS type Im)                  |
| RAS-associated autoimmune leukoproliferative disease (RALD)          | Somatic mutation in <i>KRAS</i> (GOF)   | Normal  | B cell lymphocytosis                         | Normal or increased | Splenomegaly, lymphadenopathy, autoimmune cytopenias, granulocytosis, monocytosis/ALPS-like autoantibodies/ALPS-like           |
| RAS-associated autoimmune leukoproliferative disease (RALD)          | Somatic mutation in <i>NRAS</i> (GOF)   | Increased CD4–CD8– double negative (DN) T alpha/beta cells    | Lymphocytosis                                | Normal or increased | Splenomegaly, lymphadenopathy, autoantibodies/ALPS-like  |
| Cryopyrinopathy, (Muckle-Wells/ CINCA/NOMID-like syndrome)           | Somatic mutation in <i>NLRP3</i>        | Normal  | Normal                                       | Normal              | Urticaria-like rash, arthropathy, neurological signs   |
| Hypereosinophilic syndrome due to somatic mutations in <i>STAT5b</i> | Somatic mutation in <i>STAT5B</i> (GOF) | Normal  | Normal                                       | Normal              | Eosinophilia, atopic dermatitis, urticarial rash, diarrhea   |
| <b>Associated with autoantibodies</b>                                |   |   |  |                     |  |
| Chronic mucocutaneous candidiasis                                    | AutoAb to IL-17 and/or IL-22            | Normal  | Normal                                       | Normal              | Endocrinopathy, chronic mucocutaneous candidiasis/CMC  |
| Adult-onset immunodeficiency with susceptibility to mycobacteria     | AutoAb to IFN $\gamma$                  | Decreased naive T cells                                       | Normal                                       | Normal              | Mycobacterial, fungal, <i>Salmonella</i> VZV infections/MSMD, or CID   |
| Recurrent skin infection   | AutoAb to IL-6                          | Normal  | Normal                                       | Normal              | Staphylococcal infections/STAT3 deficiency   |
| Pulmonary alveolar proteinosis                                       | AutoAb to GM-CSF                        | Normal  | Normal                                       | Normal              | Pulmonary alveolar proteinosis, cryptococcal meningitis, disseminated nocardiosis/CSF2RA deficiency                            |
| Acquired angioedema  | AutoAb to C1 inhibitor                  | Normal  | Normal                                       | Normal              | Angioedema/C1 INH deficiency (hereditary angioedema)   |
| Atypical hemolytic uremic syndrome                                   | AutoAb to Complement Factor H           | Normal  | Normal                                       | Normal              | aHUS = Spontaneous activation of the alternative complement pathway  |
| Thymoma with hypogammaglobulinemia (Good syndrome)                   | AutoAb to various cytokines             | Increased CD8+ T cells  | No B cells                                   | Decreased           | Invasive bacterial, viral or opportunistic infections, autoimmunity, PRCA, lichen planus, cytopenia, colitis, chronic diarrhea |

*aHUS* atypical hemolytic uremic syndrome, *XL* X-linked inheritance, *AR* autosomal recessive inheritance, *AD* autosomal dominant inheritance, *LOF* loss-of-function, *GOF* gain-of-function, *PRCA* pure red cell aplasia

Total number of conditions for Table 10: 12

**Acknowledgments** The members of the Inborn Errors of Immunity committee would like to thank the International Union of Immunological Societies (IUIS) for funding, as well as CSL Behring, Baxalta and Shire/Takeda for providing educational grants to enable us to compile this classification update.
