While I was perusing some of the articles listed in this bibliography I happened upon a few quotations which I find interesting or humorous, and so have included them below:

Some of these nudibranchia have their soft slug-like bodies painted with the most vivid colours, pure blues, yellows, crimson, and green, excelling the most gorgeous flowers, the form of whose blossoms are in a manner represented by the delicate petal-like plumes of their breathing organs.

--page 106, in: **Spratt**, Thomas Abel Brimage, & Edward **Forbes**. 1847. Travels in Lycia, Milyas, and the Cibyratis, in company with the late Rev. E. T. Daniell, Vol. 2, viii + 332 pp. John van Voorst, Paternoster Row.

The exposed nature of the coast is not favorable to the use of the dredge, and consequently very few exploration have been made with that useful aid to the naturalis. Our own exploits in that way, we must confess to have been nearly complete failures, owing principally to our inability to stand the exposure and motion of an open sea.

--page:101, in: **Alder**, J. 1848. Catalogue of the Mollusca of Northumberland and Durham. Transactions of the Tyneside Naturalists' Field Club 1:97-209, 358-365.

The activity of different species of animals often renders their capture difficult. When marine, the use of the dredge entails a consumption of time such as can rarely be spared by those who have other paramount duties to perform, putting out of account the amount of visceral commotion the unpractised sailor is doomed to endure, and which requires a large zoological profit to compensate, under such circumstances, for the want of pleasure in procuring it.

--page 3, in: **Byerley**, Isaac. 1854. The fauna of Liverpool. Proceedings of the Literary and Philosophical Society of Liverpool (8) append., pp. 1-125, 1 pl.

If the shell-bearing molluscs are remarkable for the elegant form and brilliant colouring of their habitations, they seem to be equalled, if not eclipsed, in beauty by a race of molluscs which possess no shell at all, and whose chief beauty is derived from the singular peculiarity of formation from which their name is derived. These are the Nudibranchs, or Naked-gilled Molluscs, so named because their respiratory apparatus, instead of being concealed within their bodies, or defended by shells, is placed upon the exterior, in apparently heedless defiance of surrounding objects. And the more that the delicate construction of these branchiae is seen, the more wonderful does it appear that these organs should be placed in the position which they occupy without suffering serious injury...

There are many species of Nudibranchs found on our coasts, one of the commonest of which (*Doris pilosa*) is represented on plate N, fig. 4. The gills may be seen spreading like a feathery plume, or a radiating flower, on the upper surface of the creature. The position of the branchiae is by no means uniform, for indeed the most fertile imagination would hardly venture to depict such fantastic forms as are found among the Nudibranchs, or, if they were depicted, could hope that such wondrous shapes should be received by men as existing in the same world with themselves.

Some species, like those whose shape has been already alluded to, are nearly flat, and wear their lungs much as a gentleman wears a bouquet, in his button-hole. Others have their lungs neatly arranged round their bodies in little spreading tufts, so that the creature has something the aspect of a floriated coronet. Some have their whole dorsal surface thickly studded with lungs, so that it would bear a decided resemblance to a hedgehog, were it not that the spikes must be semitransparent, and tinged with the most exquisite colours. Again, there are some species which carry their lungs at a distance from their bodies, and present them to the waves, as if they were holding the branchiae in the hands of their outstretched arms; while there are some whose forms are so utterly unique and grotesque, that a description would be useless except it were accompanied by a drawing.

As to the colouring of these creatures, there is hardly a tint, from blackish grey to the most brilliant carmine, that is not found in some member of this strange family. They all belong to that division of the molluscs that go by the name of Gasteropoda, because the lower surface of the body forms the foot by which they move from place to place. By the aid of this foot they often float on the surface of the water, as has been already recorded of other molluscs. This action, however, has been well described, as creeping on the superincumbent stratum of air. Many species of the genera *Doris* and *Eolis*, together with others, may be found, at low water, clinging to the rocks and stones. They

will hardly be recognised as Nudibranchs at a hasty glance, for they subside into shapeless gelatinous knobs as soon as the waves leave them, and do not resume their expanded form until the surging sea returns.

--pages 24-26, in: **WOOD**, J. G. 1858. Common objects of the sea shore; including hints for an aquarium, iv + 132 pp. G. Routledge & Co.

Doris, with gills resembling an expanded flower, displayed upon the hinder region of the back; and Eolis, adorned with painted ornaments, most gracefully disposed, bedight with tints so brilliant and harmonious, that it might almost be taken for a bed of flowers endowed with life, and wandering about to show its splendours. These and a hundred more, presenting various forms of beauty, are procurable on every beach.

--pages 505-506, in: **JONES**, Thomas Rymer. 1858. The aquarian naturalist: a manual for the sea-side, xviii + 524 pp. John van Voorst, Paternoster Row, London.

Another class of widely diffused beings, not yet sufficiently investigated on the Arran shores, and which, like the *Annelids* are worthy of a more honourable name than is assigned to them in popular language, are the *Sea slugs*, known in scientific phraseology, as the *Nudibranchiate mollusca*. These are within the reach of every observer--for, at low water, they may be seen reposing under loose stones or adhering to *Algae*. Some of the species, especially of the genus *Eolis*, are really charming objects--elegant in form, and beauteous in colour. They cannot be mistaken. Place a specimen in a tumbler of sea water, it will unfold itself, and its gills, differently situated in different species, will be seen expanding into full operation as the little creature pursues its journey round the sides of the vessel. It enjoys the learned appellation of *Nudibranch*, because its *branchiae*, or breathing organs, are *naked*, or exterior to the body of the animal.

--page 189, in: **BRYCE**, James. 1859. Geology of Clydesdale and Arran; embracing also the marine zoology and the flora of Arran, with complete list of species; note on the rarer insects or Arran; and notices of its scenery and antiquities, 199 pp. Richard Griffin & Co., London & Glasgow.

This cold, shapeless lump of dark quivering jelly, not unlike a ripe grape saturated with water and stripped of its skin, and not at all pleasant to touch, undergoes a pleasing transformation when placed in a bell-glass with some of its native element; it swells and expands, and stretches until it becomes a gorgeous mollusc of emerald green, --a Nudibranch, of the family Doridae, wearing his plumose lungs in a coronal wreath on the hinder part of his broad, flat back; his curiously-formed tentacles are far back on his neck, with eye-specks at their roots; his skin is covered with vibratile cilia, and is full of calcareous spicules; he is all over little horns; he is the *Polycera Lessonii* of D'Orbigny. No doubt he has just risen from his calm retreat amongst the rocks under a tangled forest of *Laminaria*, after a heavy supper of zoophytes and sponges, with perhaps a bit of "dead man's thumb", *Alcyonium digitatum*, by way of a finish, to take his evening stroll at the top of the water, walking upon it, or rather, just underneath it, with his back downwards, and the expanded sole of his one flat foot turned up to the veiled sky; or he may have finished his after-supper mile, and have been taking a comfortable snooze, suspended from the surface by the tip end of his tail (which he had previously buoyed by throwing out a horizontal film of mucus), and hanging head downwards, regardless of apoplexy.

--page 200, in: **HOLLAND**, J. Y. 1870. The towing-net. Hardwicke's Science-Gossip: an Illustrated Medium of Interchange and Gossip for Students and Lovers of Nature 6:193-202.

But in one section of the Mollusca-the Sea Slugs (Nudibranchiata)-the beauty of colour is such that a parallel to it can only be found amongst the fairest of floral tints. These graceful creatures-for there may be grace even in a Slug, as anyone who has studied their movements will readily admit-are commonly tinged with the most exquisite dyes, or painted with the richest patterns, a peculiar delicacy and tenderness being imparted to the colours, by the perfect transparency of the tissues. The members of this lovely tribe are abundant in Salcombe Bay; the most beautiful forms come up frequently in the dredge, showing as brilliant specks of jelly, and looking like little gems; and it was pleasant to meet occasionally with one of Montagu's rarer species, reminding us that we were on the classical dredging ground of this admirable naturalist.

--page 42, in: **HINCKS**, T. 1871. Reminiscences of dredging. The Student & Intellectual Observer of Science, Literature and Art 5:37-49.

It will be as well to devote a few remarks to certain molluscs which, although they have no shells, are classed as gasteropods. They may be found clinging to or lying under rocks and stones at low water; and many of them compensate for their lack of elegant shells by their brilliant colours. On account of the way in which the gills are exposed, they are called nudibranchs, or "naked-gilled" molluscs. Popularly they go by the names of "sea-lemons," "sea-slugs," "sea-hares," &c. In fact, we may regard them as occupying a similar position in the marine world to that which the common black and yellow garden slugs do on land. Singularly enough, the nudibranch molluscs have an embryonic shell when young, which they lose as they approach the adult condition--a fact which throws some light on their descent, and indicates that they may be derived from ancestors which possessed a shell, and were true univalves. The gills, or branchiae, are arranged in tufts along the back and sides, hence the name of the order. The nervous system is very highly developed, so much so that some naturalists regard them as holding the highest position among the gasteropods.

--page 193, in: **TAYLOR**, John Ellor. 1872. Half hours at the sea-side; or, recreations with marine objects, xii + 260pp. Robert Hardwicke.

The branchiae, especially of the Nudibranchia, take every conceivable form of leaf, tree, flower and branch, adorned with every colour of the rainbow. Many of them are delicately branched like little trees, and doubly and trebly pinnated like the fronds of ferns.

--page 491, in: **MACMILLAN**, Hugh. 1874. The prophecies of ferns. Evening Hours, A Family Magazine, New Series 1:490-496.

The rocks and grottoes of the ocean are as richly carpeted with a verdure of their own, as our hills and valleys. Seaweeds and corallines, exquisite in colour and beautiful in form, clothe them in rich profusion. But though away from the view of man or of those animals with whom he is more familiar, there are creatures formed to revel in this luxuriant growth, and to whom it affords a continual banquet. The tritonia, a kind of marine slug, is one of these, and it is furnished with scissors to clip off the living flowers which serve it for sustenance.

The mouth of the tritonia is of a most singular construction. Enclosed within two fleshy lips, which form the external part of this organ, lie two flat horny jaws, united at one end by an elastic joint; a strong muscle brings together the sharp jaws, which pass one over the other like the blades of shears, and are enclosed again by the spring which connects them. Within this destructive mouth is a tongue covered with sharp hooks, all bent in the direction of the throat, to which they convey the ample supply of food prepared by the jaws.

--pages 212-213, in: **ANONYMOUS**, 1878. The London readers. fifth reader, with numerous illustrations, 288 pp.. Daldy, Isbister & Co., London.

Walking still under the great cliffs we reach some sandy pools, where we take off our shoes and stockings, tuck up our skirts, and paddle in good earnest with our shrimping nets; quite an excitement prevails when an occasional prawn is found leaping in the net, and we have soon quite a jar full of shrimps, and I light on a treasure, a brilliantly-coloured mollusc of some sort, with a flower-like appendage on his back, and a small pair of horns, is captured and put away among the anemones. "What an ornament for our aquarium," we say, and complacently get out our book to investigate its story. "Oh, it is a nudibranch, and those are its lungs; how interesting to watch!" "But what is this?" cries another; "the book says, 'a wolf would be about as appropriate an inmate of a sheepfold as a nudibranch of an aquarium. of sea-anemones.' Oh, turn out the voracious creature quickly; it shall have a place to itself."

--page 396, in: **YONGE**, Charlotte Mary (Ed.). 1883 Spider subjects, a country sea-side walk. In: Monthly packet of evening readings for members of the English Church, ser. 3, 6(4)394-397. J. & C. Mozley; Walter Smith.

The tongue, odontophore, or palate of the Mollusca, has long formed an interesting microscopic object on account of the elegant horny or chitinous teeth situated upon it, in numerous rows and in various patterns.

--page 771 in: **GRIFFITH**, J. W. [John William], & Arthur **HENFREY**. 1883. The micrographic dictionary; a guide to the examination and investigation of the structure and nature of microscopic objects, 4th edition, edited by J. W. Griffith, assisted by M. J. Berkeley, & T. Rupert Jones, vol. I.--text, xlvi + 829 pp. London: John van Voorst.

The beauty of these animals corresponds with their charming mythological names, for every part of them which is not sparkling like the purest crystal shines with the liveliest colours, red, yellow, or azure. Some inhabit the coasts, where they creep along upon a well-developed foot, others live in the deep waters, where they cling to the stems of floating sea-weed with a narrow and furrowed foot, or swim upon their back, using the borders of the mantle and of the branchiae as oars.

--page 283, in: **HARTWIG**, Georg. 1892. The sea and its living wonders, a popular account of the marvels of the deep and of the progress of maritime discovery from the earliest ages to the present time, 9th ed., xx + 524 pp.. Longmans, Green, & Co., London.

The Nudibranchiata are divided into Elysioidea, Tritonioidea, Æolidioidea and Doridoidea.

Though they occur on every sea-coast they are not forms often met with by the ordinary student, and hence will not be discussed in further detail.

-- page 641, in: **LYDEKKER**, R., W. F. [William Forsell] **KIRBY**, B. B. [Bernard Barham] **WOODWARD**, R. **KIRKPATRICK**, R. I. **POCOCK**, R. B. **SHARPE**, W. [Walter] **GARSTANG**, F. A. **BATHER**, & H. M. **BERNARD**. 1897. Natural history the Concise Knowledge Library, xvi + 771 pp. New York, D. Appleton & Co.

Among the trophies of the day were some exceedingly beautiful Aeolids of pure white, with edges painted in brilliant yellow. These nudibranch mollusks are the veritable butterflies of the sea. Their colors are startlingly vivid and their schemes of decoration often fantastic and wonderful. This extensive group of beautiful creatures inhabiting all seas, of infinite variety and of superlative interest, offer a most inviting field for investigation. Many genera and species have been described and illustrated in color plates, but every day's collecting in favorable stations brings to hand specimens that defy identification and are more beautiful than any yet pictured in books. It takes a practiced eye to detect them in the mess of rubbish dumped from the dredge, for when disturbed these delicate creatures contract into shapeless little masses that appear to be of no importance and are allowed to fall into the discard. When placed, however, in a jar of clear sea water and permitted to rest for a time undisturbed, these little lumps of nothingness gradually unfold into exquisite beings. For purposes of preservation, the beauty of our nudibranch is like the loveliness of the orchid,-evanescent and fleeting. Unless killed and expanded with greatest care the graceful body shrinks into shapeless distortion in alcohol or formalin and even at best the glorious colors soon fade. The poor little creature, bereft of its soul of beauty, presents a pitiful object for study when finally placed in its graveyard of bottles upon some museum shelf.

--pages 122-123, in: **HENDERSON**, John Brooks. 1916. The cruise of the Tomas Barrera: the narrative of a scientific expedition to western Cuba and the Colorados Reefs, with observations on the geology, fauna, and flora of the region, ix + 320 pp. G. P. Putnam's Sons.

Harmless, even kindly as botanists in general appear, how is it that they take delight in embittering the lives of laymen by their eternal juggling with the names of genera and species? [for "botanists" read: taxonomists].

--page 46, in: **CASE**, J. Smeaton. 1919. California desert trails: two years of adventure, xvi + 387 pp. Houghton Mifflin Co., Boston & New York.

The author of this article is an American naturalist, who has made a special study of the nudibranchs. The group has been neglected by nearly all our conchologists, and a worker in the Australian field is assured of a rich harvest.-- Editor.

--page 87, in: **UNDERHILL**, Julia Adams. 1929. Notes on the nudibranchs (sea-slugs). Victorian Naturalist 46(4):84-87.

Nudibranchs, or sea slugs, particularly the genera *Aeolidia*, *Glaucus*, and *Hermisenda*, feed on various coelenterates and then incorporate the stinging nematocysts into their own bodies for defensive purposes. A sting from one of these nudibranchs is not unlike that of the coelenterate itself. **Nudibranchs often are brightly colored animals but specific identification is difficult and therefore contact with any of these animals should be avoided.** [emphasis added].

--page 113, in: **BOWLES**, David E., & James A. **SWABY**. 2006. Field guide to venomous and medically important invertebrates affecting military operations: identification, biology, symptoms, treatment. Version

2.0, 31 July 2006, 142 unnumbered pages. USAF Institute for Operational Health, Brooks City-Base, TX.

It is the fallacy of present ages to assume that old is synonymous with anachronistic or, worse yet, faulty and worthless. In reality, care of observation and accuracy of representation in texts and images one hundred or more years old may surpass anything that we produce today. Knowledge obtained long ago can be highly relevant to our current world.

--ENGEL, Michael S. 2018. Innumerable insects, the story of the most diverse and myriad animals on earth, 232 pp. American Museum of Natural History, Natural Histories. New York: Sterling Publishing.

The beginning of wisdom is to call things by their proper name.

--Confucius
