' or '

Either form of the apostrophe here stands for what is known in linguistics as a glottal stop when it appears after a vowel. When it appears after a consonant it stands for what is known in linguistics as glottalization; when it occurs after consonants it is treated as part of the characters that make up that letter in the Stó:lô writing system. Only on very rare cases, in Upriver Halkomelem, does glottal stop occur after a consonant when that consonant is also found glottalized in other words; to show an actual glottal stop follows such a plain consonant, they are separated with a dash, as in <ets-'ets> *stutter*.

While glottal stop is rare at the end of a word and before consonants in Upriver Halkomelem (most have changed to length), glottal stop actually occurs as the onset of every word spelled with an initial vowel in the Stó:lô writing system. Since it is predictable there, it is not written there. The same is true for most root forms beginning in this dictionary; any written with an initial vowel begin with a glottal stop when they occur word initially; some also have the glottal stop when prefixed, as in <s'ith'em> *clothes*. Some never occur word initially and do not have a glottal stop when prefixed. When reduplicated those roots which have an initial glottal stop, also copy it as C1 (consonant 1 of the root).

Since the apostrophe is not written at the start of words and roots with initial glottal stop, there are no entries needed for this letter in the Stó:lô orthography. In the other dialect groups of Halkomelem, Downriver Halkomelem and Island Halkomelem, glottal stop can occur after most if not all consonants and is much more frequent. Thus a separate symbol is needed in those dialects for glottal stop, so that glottalized consonants and consonant followed by glottal stop can be shown correctly and separately. Tesó:s te mestíyexw!

In some cases a glottal stop is added to separate a vowel final root or stem and a vowel initial suffix, but more often the vowels are allowed to merge and combine according to rules described in Galloway 1977 and 1993. In the international phonetic alphabet, glottal stop is written with a question mark without the dot. Below are two examples. The first shows a reduplicated stem with the glottal stop reduplicated. The second example shows a suffix which sometimes uses glottal stop to separate it from a root or stem which ends in a vowel. In both cases I have spelled the stem or suffix with an apostrophe to show how it works, but in the dictionary and writing system normally, the initial glottal stop or apostrophe will always be left off. Thus will be found under the letter <a> under <al'álíy> and the suffix will be found under <=ó:ylha> in the letter <o>.

<'al'álíy> (normally written <al'álíy>), VALJ ['all good'], see éy ~ éy:.

<=(')ó:ylha> (normally written <=ó:ylha>), da //=(?)á.y†ε//, EB ['(wooden?)'], perhaps originally a compound with root <yo:lh> *cut tree, log* plus metathesis yielding <=o:ylh> plus <=e ~ =a> *living entity*, could less plausibly be seen as <=á:y> *bark, plant, wool, covering*, possibly <=lh> *past tense*, syntactic analysis: lexical suffix, compare <=ó:ylh ~ =iylh> (*bed?*)??; found in <mímele'ó:ylha>, //C₁í=məle=ʔ=á.y†ε//, /'doll/ (from <mímele> *baby, tiny child* (with <R4=> *diminutive* + <méle> *child*); <=ó:ylh=a> should be compared to <s=yó:lh> *firewood, wood* and <s=yó:ylh> *little firewood, little stick of wood* and <=a> *living thing* contrast <=iylh> *child or young*. In my data the word for *doll* is the only example.
