**Abstract.** We study the effect of the fast rotation and vertical viscosity on the lifespan of solutions to the three-dimensional primitive equations (also known as the hydrostatic Navier-Stokes equations) with impermeable and stress-free boundary conditions. Firstly, for a short time interval, independent of the rate of rotation  $|\Omega|$ , we establish the local well-posedness of solutions with initial data that is analytic in the horizontal variables and only  $L^2$  in the vertical variable. Moreover, it is shown that the solutions immediately become analytic in all the variables with increasing-in-time (at least linearly) radius of analyticity in the vertical variable for as long as the solutions exist. On the other hand, the radius of analyticity in the horizontal variables might decrease with time, but as long as it remains positive the solution exists. Secondly, with fast rotation, i.e., large  $|Ω|$ , we show that the existence time of the solution can be prolonged, with "well-prepared" initial data. Finally, in the case of two spatial dimensions with  $\Omega = 0$ , we establish the global well-posedness provided that the initial data is small enough. The smallness condition on the initial data depends on the vertical viscosity and the initial radius of analyticity in the horizontal variables.

**Keywords.** Anisotropic vertically viscous primitive equations, Fast rotation, Well-posedness theory, Hydrostatic Navier-Stokes equations.

## **1. Introduction**

We consider the following 3D viscous primitive equations (PEs) with only vertical viscosity for the largescale oceanic and atmospheric dynamics:

<span id="page-1-1"></span><span id="page-1-0"></span>
$$
\partial_t \mathcal{V} + \mathcal{V} \cdot \nabla \mathcal{V} + w \partial_z \mathcal{V} - \nu \partial_{zz} \mathcal{V} + \Omega \mathcal{V}^\perp + \nabla p = 0, \tag{1.1a}
$$

$$
\partial_z p = 0,\tag{1.1b}
$$

<span id="page-1-5"></span><span id="page-1-2"></span>
$$
\nabla \cdot \mathcal{V} + \partial_z w = 0,\tag{1.1c}
$$

in the horizontal channel  $\mathcal{D} := \{ (\boldsymbol{x}, z)^\top = (x, y, z)^\top : \boldsymbol{x}^\top \in \mathbb{T}^2, z \in (0, 1) \}$ , subject to the following initial and boundary conditions:

<span id="page-1-4"></span><span id="page-1-3"></span>
$$
\mathcal{V}|_{t=0} = \mathcal{V}_0,\tag{1.2}
$$

$$
(\partial_z \mathcal{V}, w)|_{z=0,1} = 0, \text{ and } (\mathcal{V}, w) \text{ are periodic in } x \text{ with period 1.}
$$
 (1.3)

Here the horizontal velocity field  $V = (u, v)^{\top}$ , the vertical velocity w, and the pressure p are the unknowns of the initial-boundary value problem. The 2D horizontal gradient is denoted by  $\nabla = (\partial_x, \partial_y)^\top$ . The positive constant  $\nu$  is the vertical viscosity coefficient.  $\Omega V^{\perp} = \Omega(-v, u)^{\top}$  represents the Coriolis force with magnitude  $|\Omega| \in \mathbb{R}^+$ . As one will see later, the Coriolis force induces linear rotation waves with rotating rate  $|\Omega|$ . The 3D viscous PEs can be derived as the asymptotic limit of the small aspect ratio between the vertical and horizontal length scales from the Boussinesq system, which is justified rigorously first in [\[1](#page-42-0)] in a weak sense, then later in [\[41](#page-43-0)] in a strong sense with error estimates (see also a recent

paper [\[42\]](#page-43-1) for the PEs with anisotropic horizontal viscosity). Notice that we have omitted the coupling with temperature in  $(1.1)$  for the sake of simple and clear presentation. System  $(1.1)$  is also referred to as the anisotropic vertically viscous hydrostatic Navier-Stokes equations.

The global well-posedness of strong solutions to the 3D PEs with full viscosity was first established in [\[15\]](#page-42-2), and later in [\[32](#page-43-2)]. See also [\[37](#page-43-3),[38\]](#page-43-4) for different boundary conditions, and [\[27\]](#page-43-5) for solutions with less regular initial data. In  $[11-13]$  $[11-13]$ , the authors consider global well-posedness of strong solutions to the 3D PEs with only horizontal viscosity.

In the inviscid case without rotation  $(\Omega = 0)$ , the linear ill-posedness of solutions in Sobolev spaces has been established in [\[47](#page-43-6)]. Later on, the nonlinear ill-posedness of the inviscid PEs without rotation was established in [\[26\]](#page-43-7). Moreover, without rotation, it was proved that smooth solutions to the inviscid PEs can develop singularity in finite time [\[10](#page-42-5),[48\]](#page-43-8). It is shown later in [\[29\]](#page-43-9) that these results can be extended to the case with rotation, i.e.,  $\Omega \neq 0$ . Recently, the stability of the blowup is studied in [\[17](#page-42-6)]. Under some structural (local Rayleigh condition) or analyticity assumption of the initial data, the well-posedness theory was studied in  $[8,9,23,24,35,36,44]$  $[8,9,23,24,35,36,44]$  $[8,9,23,24,35,36,44]$  $[8,9,23,24,35,36,44]$  $[8,9,23,24,35,36,44]$  $[8,9,23,24,35,36,44]$  $[8,9,23,24,35,36,44]$  $[8,9,23,24,35,36,44]$  $[8,9,23,24,35,36,44]$ . In particular, it has been shown that the lifespan of solutions to the 3D inviscid PEs can be prolonged provided that the rate of rotation is fast enough and the initial data is "well-prepared" in [\[23](#page-42-9)]. Similar results have been studied in the case of the 3D fast rotating Euler, Navier-Stokes, and Boussinesq equations in  $[3-6,16,18,19,30,33]$  $[3-6,16,18,19,30,33]$  $[3-6,16,18,19,30,33]$  $[3-6,16,18,19,30,33]$  $[3-6,16,18,19,30,33]$  $[3-6,16,18,19,30,33]$  $[3-6,16,18,19,30,33]$  $[3-6,16,18,19,30,33]$  (see also  $[2,25,34,43]$  $[2,25,34,43]$  $[2,25,34,43]$  $[2,25,34,43]$  $[2,25,34,43]$  for some explicit examples demonstrating the mechanism).

For the PEs with only vertical viscosity, it has been shown in [\[47\]](#page-43-6) that system [\(1.1\)](#page-1-0) is ill-posed in any Sobolev space. This ill-posedness can be overcome by considering additional linear (Rayleigh-like friction) damping, see [\[14](#page-42-17)] for the reduced  $3D$  case. On the other hand, with Gevrey regularity and some convex conditions on the initial data, the local well-posedness is established in [\[22](#page-42-18)]. When the initial data is analytic in the horizontal variables *x* and is sufficiently small, the global well-posedness is proved in [\[46\]](#page-43-18) in 2D, with  $\Omega = 0$  and Dirichlet boundary condition. In this paper, we consider [\(1.1\)](#page-1-0) in 3D, with arbitrary  $\Omega \in \mathbb{R}$  and subject to impermeable and stress-free boundary conditions.

The main results of this paper are roughly summarized as follows:

- R1 Local well-posedness (see Theorem [3.1\)](#page-9-0): Assume that  $V_0$  is analytic in the horizontal variables x and only  $L^2$  in the vertical variable z. Let  $\Omega \in \mathbb{R}$  be arbitrary but fixed. Then there exists a positive time  $T > 0$ , independent of  $\Omega$ , such that there exists a unique Leray-Hopf type weak solution V to system  $(1.1)$  (see Definition [3.1,](#page-9-1) below). Moreover the weak solution V depends continuously on the initial data and in particular it is unique.
- R2 Instantaneous analyticity in the vertical variable (see Theorem [3.2\)](#page-15-0): With the same assumptions as in R1 above, the unique Leray-Hopf type weak solution  $\mathcal V$  immediately becomes analytic in z for  $t > 0$ . Moreover, thanks to the viscous effect the radius of analyticity in z increases in time, at least linearly, for as long as the solution exists. On the other hand, the radius of analyticity in the horizontal variables might decrease with time, but as long as it remains positive the solution exists.
- R3 Long-time existence (see Theorem [5.1\)](#page-21-0): Let  $|\Omega| \geq |\Omega_0|$  with  $|\Omega_0|$  large enough, in particular  $|\Omega_0| > 1$ . Assume that the analytic-Sobolev norm (see [\(2.3\)](#page-4-0), below) of both the barotropic mode  $\overline{\mathcal{V}}_0$  and baroclinic mode  $\widetilde{\mathcal{V}}_0$  are  $\mathcal{O}(1)$ , and that some Sobolev norm of  $\widetilde{\mathcal{V}}_0$  is  $\mathcal{O}(\frac{1}{|\Omega_0|})$ , as  $|\Omega_0| \to \infty$ . Then a lower bound,  $\mathcal{T}$ , of the existence time of the Leray-Hopf type weak solution to system  $(1.1)$  with  $|\Omega| \geq |\Omega_0|$  satisfies

<span id="page-2-0"></span>
$$
\mathcal{T} = \mathcal{O}(\log[\log[\log(\log(|\Omega_0|))]]]) \to \infty \text{ as } |\Omega_0| \to \infty.
$$
\n(1.4)

Moreover, as a corollary of R2, the solution is analytic in all variables (see Remark [11,](#page-22-0) below).

R4 Long-time existence with small barotropic mode (see Theorem [5.2\)](#page-22-1): Let  $|\Omega| \geq |\Omega_0| > 1$  and  $|\Omega_0|$  be large enough.

(a) Under the assumption that the solution  $\overline{V}$  to the 2D Euler equations with initial data  $\overline{V}_0$ is uniformly-in-time bounded in the analytic space norm,  $(1.4)$  can be improved to  $\mathcal{T} =$  $\mathcal{O}(\log(\log(\vert\Omega_0\vert)))$ . Let us note that this result is parallel to a similar one in the inviscid case [\[23\]](#page-42-9).

- (b) Moreover, under the assumption that  $\overline{V}$  is uniformly-in-time small enough (the smallness condition is independent of  $|\Omega_0|$ ) in the analytic space norm, the smallness requirement on the Sobolev norm of  $V_0$  can be relaxed and is independent of  $\Omega_0$ , and  $(1.4)$  can be improved to  $\mathcal{T} = \mathcal{O}(\log(|\Omega_0|))$ , as  $|\Omega_0| \to \infty$ . In view of work reported in [\[31](#page-43-19)] about the growth of solutions of 2D Euler equations, we observe that the above assumptions about the smallness of  $\overline{V}$  might not be valid for all initial data.
- (c) If the analytic norm of  $\overline{V}_0$  is of order  $\mathcal{O}(\frac{1}{|\Omega_0|})$ , as  $|\Omega_0| \to \infty$ , then the smallness requirement on the Sobolev norm of  $\widetilde{V}_0$  can be relaxed and independent of  $\Omega_0$ ; moreover, [\(1.4\)](#page-2-0) can be improved to  $\mathcal{T} = \mathcal{O}(|\Omega_0|^{\frac{1}{2}})$ .
- R5 Global well-posedness in 2D with  $\Omega = 0$  (see Theorem [6.1\)](#page-34-0): In the 2D case with  $\Omega = 0$ , suppose that the initial data  $V_0$  is analytic only in the horizontal variable with small analytic-Sobolev norm (the smallness condition depends on  $\nu$  and the initial radius of analyticity  $\tau_0$ ). Then the unique Leray-Hopf type weak solution exists globally in time. Furthermore, R2 implies that the solution is analytic in all variables.

Compared to the inviscid case [\[23\]](#page-42-9), this paper investigates the combined effect of the fast rotation and the vertical viscosity. The main differences are the following:

- With analytic initial data in all variables, aside from the fast rotation, we do not observe the effect of the vertical viscosity in prolonging the lifespan in comparison to the inviscid case in [\[23](#page-42-9)].
- However, with a larger class of the initial data, namely with initial data analytic in the horizontal  $x_y$ -variables and only Sobolev in the z-variable, the vertical viscosity allows us to establish the local well-posedness, which is not possible for the inviscid case (see [\[47\]](#page-43-6)). Moreover, the existence time is proportional to  $\nu$  and shrinks to zero as  $\nu \to 0$  (see [\(3.6\)](#page-11-0)), which is consistent with the ill-posedness result in the inviscid case.
- Such a regularizing effect of the vertical viscosity can also be seen in the proof of Theorem [5.1](#page-21-0) in [\(5.32\)](#page-30-0) and the absorbing argument [\(5.36\)](#page-30-1).

Compared to the work [\[46](#page-43-18)], which studies the 2D model subject to Dirichlet boundary condition without rotation, we investigate here both the  $2D$  and  $3D$  models subject to the impermeable and stress-free boundary conditions. While recognizing the subtle difference between the imposed boundary conditions and their mathematical and physical implications, the result reported in [\[46](#page-43-18)] is, roughly speaking, along the lines of the statement in R5, above, focusing on the 2D case. Meanwhile, our main objective in this contribution is to study the combined effect of the fast rotation and viscosity in the 3D case, as it has been summarized in R1 – R4 above.

The paper is organized as follows. In section [2,](#page-3-0) we introduce the notations and some preliminary results which will be used throughout this paper. In section [3,](#page-9-2) we establish the local well-posedness of system  $(1.1)$  and instantaneous analytic regularity in the vertical variable by proving Theorem [3.1](#page-9-0) (i.e., R1) and Theorem [3.2](#page-15-0) (i.e., R2). In section [4,](#page-17-0) we derive the formal limit resonant system of  $(1.1)$  when  $|\Omega| \to \infty$  and establish some properties about the limit system. Section [5](#page-21-1) is the centerpiece of this paper and is devoted to studying the effect of rotation, where we prove Theorem [5.1](#page-21-0) (i.e., R3) and Theorem [5.2](#page-22-1) (i.e., R4). In section [6,](#page-34-1) we prove the global well-posedness in the 2D case with  $\Omega = 0$ , i.e., Theorem [6.1](#page-34-0) (i.e., R5).

## <span id="page-3-0"></span>**2. Preliminaries**

In this section, we introduce the notations and collect some preliminary results that will be used in this paper. The generic constant C appearing in this paper may change from line to line. We use subscript, e.g.,  $C_r$ , to emphasize the dependence of the constant on r.

#### **2.1. Functional Settings**

We use the notation  $(x, z)=(x, y, z) \in \mathcal{D} = \mathbb{T}^2 \times [0, 1]$ , where x and z represent the horizontal and vertical variables, respectively.  $\mathbb{T}^2$  is the two-dimensional torus with unit length. Denote by  $L^2(\mathcal{D})$ , the Lebesgue space of complex/real valued functions  $f(x, z)$  satisfying  $\int_{\mathcal{D}} |f(x, z)|^2 dx dz < \infty$ , endowed with the norm

$$
||f||:=||f||_{L^2(\mathcal{D})}=(\int_{\mathcal{D}}|f(\boldsymbol{x},z)|^2 d\boldsymbol{x} dz)^{\frac{1}{2}},
$$

and the inner product

<span id="page-4-2"></span>
$$
\langle f, g \rangle := \int_{\mathcal{D}} f(\boldsymbol{x}, z) g^*(\boldsymbol{x}, z) \, d\boldsymbol{x} dz \tag{2.1}
$$

for  $f,g \in L^2(\mathcal{D})$ . Here  $g^*$  represents the complex conjugate of g. Given any time  $\mathcal{T} > 0$ ,  $L^p(0,\mathcal{T};X)$ represents the space of functions  $f: [0, T] \to X$  satisfying  $\int_0^T ||f(t)||_X^T dt < \infty$ , where X is a Banach space with norm  $\|\cdot\|_X$ . For a function  $f \in L^2(\mathcal{D})$ , we use  $\hat{f}_k(z)$ ,  $k \in 2\pi\mathbb{Z}^2$ , to denote its Fourier coefficients in the *x*-variables, i.e.,

<span id="page-4-1"></span>
$$
\hat{f}_{\mathbf{k}}(z) := \int_{\mathbb{T}^2} e^{-i\mathbf{k}\cdot\mathbf{x}} f(\mathbf{x}, z) d\mathbf{x}, \quad \text{and hence} \quad f(\mathbf{x}, z) = \sum_{\mathbf{k}\in 2\pi\mathbb{Z}^2} \hat{f}_{\mathbf{k}}(z) e^{i\mathbf{k}\cdot\mathbf{x}}.
$$
 (2.2)

Let  $A := \sqrt{-\Delta_h}$ , where  $\Delta_h = \partial_{xx} + \partial_{yy}$  is the horizontal Laplacian, defined by, in terms of the Fourier coefficients,

$$
\widehat{Af}_{\boldsymbol{k}}(z) := |\boldsymbol{k}| \widehat{f}_{\boldsymbol{k}}(z), \qquad \boldsymbol{k} \in 2\pi \mathbb{Z}^2.
$$

For  $r \geq 0$ , we define

$$
H^r(\mathcal{D}) := \{ f \in L^2(\mathcal{D}) : ||f||_{H^r} < \infty \},
$$

with

$$
||f||_{H^r} := \sum_{0 \le m \le r, m \in \mathbb{Z}} \left( ||A^{r-m} \partial_z^m f||^2 + ||\partial_z^m f||^2 \right)^{\frac{1}{2}}.
$$

Notice that, with  $(2.2)$ , we have

$$
\|\partial_z^m f\|^2 = \int_0^1 \Big( \sum_{k \in 2\pi \mathbb{Z}^2} |\partial_z^m \hat{f}_k(z)|^2 \Big) dz \text{ and } \|A^{r-m} \partial_z^m f\|^2 = \int_0^1 \Big( \sum_{k \in 2\pi \mathbb{Z}^2} |k|^{2(r-m)} |\partial_z^m \hat{f}_k(z)|^2 \Big) dz.
$$

In addition, given any  $r \geq 0$  and  $s \geq 0$  with  $s \in \mathbb{Z}$ , we define the anisotropic Sobolev space

$$
H_x^r H_z^s(\mathcal{D}) := \{ f \in L^2(\mathcal{D}) : ||f||_{H_x^r H_z^s} < \infty \},
$$

where the anisotropic Sobolev norm is given by

$$
||f||_{H_x^r H_z^s} := \sum_{m \le s} (||A^r \partial_z^m f||^2 + ||\partial_z^m f||^2)^{\frac{1}{2}}.
$$

On the other hand, given any  $r \geq 0$ ,  $s \geq 0$ , and  $\tau \geq 0$ , with  $s \in \mathbb{Z}$ , we define the analytic-Sobolev space

$$
\mathcal{S}_{r,s,\tau} := \{ f \in L^2(\mathcal{D}) : ||f||_{r,s,\tau} < \infty \},\
$$

where the norm is given by

<span id="page-4-0"></span>
$$
||f||_{r,s,\tau} := \sum_{m \le s} (||A^r e^{\tau A} \partial_z^m f||^2 + ||\partial_z^m f||^2)^{\frac{1}{2}},\tag{2.3}
$$

with, recalling  $(2.2)$ ,

$$
||A^r e^{\tau A} \partial_z^m f||^2 := \int_0^1 \Big( \sum_{k \in 2\pi \mathbb{Z}^2} |\mathbf{k}|^{2r} e^{2\tau |\mathbf{k}|} |\partial_z^m \hat{f}_k(z)|^2 \Big) dz.
$$

Roughly speaking,  $S_{r,s,\tau}$  is the space of functions that are analytic with radius  $\tau$  in the *x*-variables, and  $H<sup>s</sup>$  in the z-variable. The space of analytic functions is a special case of Gevrey class. For more details about Gevrey class, we refer readers to  $[20, 21, 23, 40]$  $[20, 21, 23, 40]$  $[20, 21, 23, 40]$  $[20, 21, 23, 40]$  $[20, 21, 23, 40]$ . Notice that when  $\tau = 0$ , one has  $S_{r,s,0} = H_x^r H_z^s(\mathcal{D})$ .

*Remark 1.* With abuse of notation, we also write  $f \in S_{r,0,\tau}$  for  $f = f(x)$  depending only on the horizontal variables.

<span id="page-5-0"></span>The following lemma summarizes the algebraic property of functions with analyticity in the horizontal variables:

**Lemma 2.1.** *For*  $\tau \geq 0$  *and*  $r > 1$ *, we have* 

$$
||A^r e^{\tau A}(fg)(z)||_{L_x^2} \leq C_r \Big( |\hat{f}_0(z)| + ||A^r e^{\tau A} f(z)||_{L_x^2} \Big) \Big( |\hat{g}_0(z)| + ||A^r e^{\tau A} g(z)||_{L_x^2} \Big),
$$

provided that the right hand side is bounded, where, according to  $(2.2)$ ,

$$
\hat{f}_0(z) = \int_{\mathbb{T}^2} f(\boldsymbol{x}, z) d\boldsymbol{x}.
$$

The proof of Lemma [2.1](#page-5-0) is standard. We refer to [\[20,](#page-42-19)[23,](#page-42-9)[45](#page-43-21)] for details. With  $\mathbf{k} = (k_1, k_2, k_3) \in 2\pi (\mathbb{Z}^2 \times (\mathbb{Z}_+ \cup \{0\}))$ , we define

$$
\phi_{\mathbf{k}} = \phi_{k_1, k_2, k_3} := \begin{cases} \sqrt{2}e^{i(k_1x_1 + k_2x_2)}\cos(\frac{1}{2}k_3z) & \text{if } k_3 \neq 0, \\ e^{i(k_1x_1 + k_2x_2)} & \text{if } k_3 = 0, \end{cases}
$$
 (2.4)

and

<span id="page-5-2"></span>
$$
\mathcal{V} := \{ \phi \in C^{\infty}(\mathcal{D}) \mid \phi = \sum_{k \in 2\pi \left( \mathbb{Z}^2 \times (\mathbb{Z}_+ \cup \{0\}) \right)} a_k \phi_k, \ a_{-k_1, -k_2, k_3} = a_{k_1, k_2, k_3}^* , \int_0^1 \nabla \cdot \phi = 0 \}.
$$
 (2.5)

Here  $a^*$  denotes the complex conjugate of  $a$ . Let

H := the closure of  $\mathscr V$  in  $L^2(\mathcal D)$  and  $V :=$  the closure of  $\mathscr V$  in  $H^1(\mathcal D)$ ,

with norms given by

$$
\|\cdot\|_H:=\|\cdot\|_{L^2(\mathcal{D})} \text{ and }\|\cdot\|_V:=\|\cdot\|_{H^1(\mathcal{D})}, \text{ respectively.}
$$

Then one has

$$
V \subset H \equiv H' \subset V', \quad V \hookrightarrow \hookrightarrow H \hookrightarrow \hookrightarrow V'.
$$

#### **2.2. Projections and Reformulation of the Problem**

In this paper, we assume that  $\int_{\mathcal{D}} \mathcal{V}_0(x, z) dxdz = 0$ . This assumption is made to simplify the mathematical presentation. In fact, integrating  $(1.1a)$  in  $\mathcal D$  leads to, after applying integration by parts,  $(1.1c)$ , and  $(1.3)$ ,

$$
\partial_t \int_{\mathcal{D}} \mathcal{V} d\mathbf{x} dz + \Omega \int_{\mathcal{D}} \mathcal{V}^\perp d\mathbf{x} dz = 0. \tag{2.6}
$$

Therefore, under our assumption, one has

<span id="page-5-1"></span>
$$
\int_{\mathcal{D}} \mathcal{V}(t) dx dz = \int_{\mathcal{D}} \mathcal{V}_0(\mathbf{x}, z) dx dz = 0.
$$
\n(2.7)

With slight modifications, our result applies to the case when  $\int_{\mathcal{D}} \mathcal{V}_0(\mathbf{x}, z) d\mathbf{x} dz \neq 0$ .

**73** Page 6 of [44](#page-42-1) Q. Lin et al. JMFM

Let

$$
\dot{L}^2 := \Big\{ \varphi \in L^2(\mathcal{D}, \mathbb{R}^2) : \int_{\mathcal{D}} \varphi(\boldsymbol{x}, z) d\boldsymbol{x} dz = 0 \Big\}.
$$

Denote the barotropic mode and the baroclinic mode of  $V$  by

<span id="page-6-1"></span>
$$
\overline{\mathcal{V}}(\boldsymbol{x}) := \int_0^1 \mathcal{V}(\boldsymbol{x}, z) dz \quad \text{and} \quad \widetilde{\mathcal{V}}(\boldsymbol{x}, z) := \mathcal{V} - \overline{\mathcal{V}}, \qquad \text{respectively.} \tag{2.8}
$$

From  $(1.3)$  and  $(1.1c)$ , we have

<span id="page-6-3"></span>
$$
\nabla \cdot \overline{\mathcal{V}} = \int_0^1 \nabla \cdot \mathcal{V}(\boldsymbol{x}, z) dz = -\int_0^1 \partial_z w(\boldsymbol{x}, z) dz = 0,
$$
\n(2.9)

and

<span id="page-6-0"></span>
$$
w(\boldsymbol{x}, z) = -\int_0^z \nabla \cdot \widetilde{\mathcal{V}}(\boldsymbol{x}, s) ds.
$$
 (2.10)

*Remark 2.* In the remaining of this paper, we will substitute w by its representation  $(2.10)$  without explicitly pointing it out.

Since  $\nabla \cdot \overline{\mathcal{V}} = 0$ , and  $\overline{\mathcal{V}}$  has zero mean over  $\mathbb{T}^2$  thanks to [\(2.7\)](#page-5-1), there exists a stream function  $\psi(x)$ such that  $\overline{\mathcal{V}} = \nabla^{\perp} \psi = (-\partial_y \psi, \partial_x \psi)^{\top}$ . Therefore, the space of solutions to [\(1.1\)](#page-1-0) is given by

<span id="page-6-2"></span>
$$
S := \dot{L}^2 \cap H = \left\{ \varphi \in \dot{L}^2 : \nabla \cdot \overline{\varphi} = 0 \right\} = \left\{ \varphi \in \dot{L}^2 : \varphi = \nabla^{\perp} \psi(\mathbf{x}) + \widetilde{\varphi}(\mathbf{x}, z), \text{ for some } \psi, \int_{\mathbb{T}^2} \psi(\mathbf{x}) \, d\mathbf{x} = 0 \right\}.
$$
\n
$$
(2.11)
$$

Indeed, S is the analogy of "incompressible function space" for the PEs. Here  $\overline{\varphi}$  and  $\widetilde{\varphi}$  are the barotropic and baroclinic modes of  $\varphi$ , respectively, as in  $(2.8)$ .

For  $\varphi \in L^2$ , let the rotating operator be  $\mathcal{J}\varphi := \varphi^{\perp} = (-\varphi_2, \varphi_1)^{\top}$ . Denote the Leray projection in  $\mathbb{T}^2$ by

<span id="page-6-5"></span>
$$
\mathfrak{P}_h \overline{\varphi} := \overline{\varphi} - \nabla \Delta_h^{-1} \nabla \cdot \overline{\varphi}.
$$
\n(2.12)

Here,  $\Delta_h^{-1}$  represents the inverse of Laplacian operator in  $\mathbb{T}^2$  with zero mean value. We define the analogy of the Leray projection for the PEs  $\mathfrak{P}_p : \dot{L}^2 \to \mathcal{S}$  as

$$
\mathfrak{P}_p \varphi := \widetilde{\varphi} + \mathfrak{P}_h \overline{\varphi}.
$$

Moreover, let  $\mathfrak{R}: \mathcal{S} \to \mathcal{S}$  be defined as

$$
\mathfrak{R} \varphi := \mathfrak{P}_p(\mathcal{J} \varphi).
$$

With notations as above, a direct computation shows that

$$
\mathfrak{R}\varphi=\widetilde{\varphi}^{\perp}\qquad\text{for}\quad\varphi\in\mathcal{S}.
$$

Indeed, owing to  $(2.11)$ ,  $\varphi = \nabla^{\perp} \psi(x) + \widetilde{\varphi} \in \mathcal{S}$  for some  $\psi(x)$ . Then

$$
\mathfrak{R} \varphi = \mathfrak{P}_p(\mathcal{J} \widetilde{\varphi}) + \mathfrak{P}_p(\mathcal{J} \nabla^{\perp} \psi(\boldsymbol{x})) \n= \widetilde{\varphi}^{\perp} - \underbrace{\mathfrak{P}_h \nabla \psi(\boldsymbol{x})}_{\equiv 0} = \widetilde{\varphi}^{\perp}.
$$

Therefore, the kernel of  $\Re$  is given by

<span id="page-6-4"></span>
$$
\ker \mathfrak{R} = \left\{ \varphi \in \mathcal{S} : \widetilde{\varphi}^{\perp} = 0 \right\} = \left\{ \varphi \in \mathcal{S} : \varphi = \overline{\varphi} \right\}.
$$
\n(2.13)

One can define the projection  $\mathfrak{P}_0 : \mathcal{S} \to \ker \mathfrak{R}$  by

<span id="page-6-6"></span>
$$
\mathfrak{P}_0 \varphi := \overline{\varphi} = \int_0^1 \varphi(\mathbf{x}, z) dz.
$$
\n(2.14)

Notice that  $\mathfrak{P}_0$  can be interpreted as projection to the barotropic mode. The fact that ker  $\mathfrak{R}$  coincides with the space of functions with only the barotropic mode plays an important role in our analysis.

Furthermore, let

<span id="page-7-4"></span>
$$
\mathfrak{P}_{+}\varphi := \frac{1}{2}(\widetilde{\varphi} + i\widetilde{\varphi}^{\perp}), \quad \text{and} \quad \mathfrak{P}_{-}\varphi := \frac{1}{2}(\widetilde{\varphi} - i\widetilde{\varphi}^{\perp}). \tag{2.15}
$$

Then it is easy to verify that

$$
\Re \mathfrak{P}_{\pm} \varphi = \mp i \mathfrak{P}_{\pm} \varphi,
$$

i.e.,  $\mathfrak{P}_\pm$  are the projection operators to eigenspaces of  $\mathfrak{R}$  with eigenvalues  $\mp i$ , respectively.

<span id="page-7-0"></span>Similarly to [\[18](#page-42-14)[,23](#page-42-9),[33\]](#page-43-14), Lemma [2.2](#page-7-0)[–2.3,](#page-7-1) below, summarize projection properties of  $\mathfrak{P}_0, \mathfrak{P}_+$ . For the proof, we refer readers to [\[23\]](#page-42-9) for details.

**Lemma 2.2.** *For any*  $\varphi \in L^2(\mathcal{D})$ *, we have the following decomposition:* 

$$
\varphi = \mathfrak{P}_0 \varphi + \mathfrak{P}_+ \varphi + \mathfrak{P}_- \varphi. \tag{2.16}
$$

*Moreover, we have the following properties:*

 $\mathfrak{P}_{\pm}\mathfrak{P}_{\pm}\varphi = \mathfrak{P}_{\pm}\varphi, \qquad \mathfrak{P}_0\mathfrak{P}_0\varphi = \mathfrak{P}_0\varphi, \qquad and \qquad 0 \equiv \mathfrak{P}_{\pm}\mathfrak{P}_{\mp}\varphi = \mathfrak{P}_0\mathfrak{P}_{\pm}\varphi = \mathfrak{P}_{\pm}\mathfrak{P}_0\varphi.$ 

<span id="page-7-1"></span>**Lemma 2.3.** *For*  $f, g \in L^2(\mathcal{D})$ *, we have* 

$$
\langle \mathfrak{P}_0 f, g \rangle = \langle f, \mathfrak{P}_0 g \rangle = \langle \mathfrak{P}_0 f, \mathfrak{P}_0 g \rangle \quad \text{and} \quad \langle \mathfrak{P}_\pm f, g \rangle = \langle f, \mathfrak{P}_\pm g \rangle.
$$

*Here the*  $L^2$  *inner product is defined as [\(2.1\)](#page-4-2). Moreover, if*  $f \in S_{r,s,\tau}$  *with*  $r, s, \tau \geq 0$ ,  $s \in \mathbb{Z}$ *, we have* 

$$
A^r e^{\tau A} \partial_z^s \mathfrak{P}_0 f = \mathfrak{P}_0 A^r e^{\tau A} \partial_z^s f \quad and \quad A^r e^{\tau A} \partial_z^s \mathfrak{P}_\pm f = \mathfrak{P}_\pm A^r e^{\tau A} \partial_z^s f.
$$

Let  $\Im$  be the identity operator. A direct corollary of Lemma  $2.3$  is the following:

**Corollary 2.1.** *Consider*  $r \geq 0, \tau \geq 0$ *, and*  $s \in \mathbb{Z}_+$ *. Since*  $\mathcal{V} = \mathfrak{P}_0 \mathcal{V} + (\mathfrak{I} - \mathfrak{P}_0) \mathcal{V} = \overline{\mathcal{V}} + \widetilde{\mathcal{V}}$ *, we have*  $\|\mathcal{V}\|^2 = \|\overline{\mathcal{V}}\|^2 + \|\widetilde{\mathcal{V}}\|^2$ ,  $\|\partial_z^s \mathcal{V}\|^2 = \|\partial_z^s \widetilde{\mathcal{V}}\|^2$ ,

*and*

$$
||A^r e^{\tau A} \mathcal{V}||^2 = ||A^r e^{\tau A} \overline{\mathcal{V}}||^2 + ||A^r e^{\tau A} \widetilde{\mathcal{V}}||^2, \qquad ||A^r e^{\tau A} \partial_z^s \mathcal{V}||^2 = ||A^r e^{\tau A} \partial_z^s \widetilde{\mathcal{V}}||^2.
$$

Moreover, after applying  $\mathfrak{P}_0$  and  $\mathfrak{I} - \mathfrak{P}_0$  to equation [\(1.1a\)](#page-1-1), thanks to [\(1.3\)](#page-1-3), [\(2.9\)](#page-6-3), and [\(2.10\)](#page-6-0), one can derive the evolutionary equations for  $\overline{V}$  and  $\widetilde{V}$  as follows:

<span id="page-7-5"></span><span id="page-7-3"></span><span id="page-7-2"></span>
$$
\partial_t \overline{\mathcal{V}} + \overline{\mathcal{V}} \cdot \nabla \overline{\mathcal{V}} + \mathfrak{P}_0 \Big( (\nabla \cdot \widetilde{\mathcal{V}}) \widetilde{\mathcal{V}} + \widetilde{\mathcal{V}} \cdot \nabla \widetilde{\mathcal{V}} \Big) + \nabla p = 0, \qquad (2.17a)
$$
  
\n
$$
\partial_t \widetilde{\mathcal{V}} + \widetilde{\mathcal{V}} \cdot \nabla \widetilde{\mathcal{V}} + \widetilde{\mathcal{V}} \cdot \nabla \overline{\mathcal{V}} + \overline{\mathcal{V}} \cdot \nabla \widetilde{\mathcal{V}} - \mathfrak{P}_0 \Big( \widetilde{\mathcal{V}} \cdot \nabla \widetilde{\mathcal{V}} + (\nabla \cdot \widetilde{\mathcal{V}}) \widetilde{\mathcal{V}} \Big) - \Big( \int_0^z \nabla \cdot \widetilde{\mathcal{V}}(x, s) ds \Big) \partial_z \widetilde{\mathcal{V}} + \Omega \widetilde{\mathcal{V}}^{\perp} - \nu \partial_{zz} \widetilde{\mathcal{V}} = 0. \qquad (2.17b)
$$

Here, we have abused the notation by denoting  $p - \Omega \psi$  with  $\nabla^{\perp} \psi(x,t) = \overline{\mathcal{V}}(x,t)$  as p, where  $\psi$  is the stream function of  $V$  (see  $(2.11)$ ).

*Remark 3.* According to  $(2.13)$ ,  $(2.17)$  can be viewed as the orthogonal decomposition of  $(1.1)$  into ker  $\Re$ and  $(\ker \mathfrak{R})^{\perp}$ . As  $|\Omega| \to \infty$ , formal asymptotic analysis of [\(2.17b\)](#page-7-3) assures that, for well-prepared data (i.e., data ensuring that [\(2.17b\)](#page-7-3) makes sense),  $\mathcal{V} \to 0$  in some functional space. Therefore, in the limiting equations,  $(2.17)$  converge to the 2D Euler equations at leading order. In particular, in [\[23](#page-42-9)], it has been shown that the lifespan of the solutions can be prolonged with well-prepared initial data in the inviscid case.

**73** Page 8 of [44](#page-42-1) Q. Lin et al. JMFM

According to [\(2.15\)](#page-7-4), one has  $\tilde{\mathcal{V}}^{\perp} = -i\mathfrak{P}_+\mathcal{V} + i\mathfrak{P}_-\mathcal{V}$ . Therefore, after applying  $\mathfrak{P}_{\pm}$  to [\(2.17b\)](#page-7-3), we arrive at

<span id="page-8-0"></span>
$$
\partial_t \mathfrak{P}_{\pm} \mathcal{V} + \mathfrak{P}_{\pm} \Big( \widetilde{\mathcal{V}} \cdot \nabla \widetilde{\mathcal{V}} + \widetilde{\mathcal{V}} \cdot \nabla \overline{\mathcal{V}} + \overline{\mathcal{V}} \cdot \nabla \widetilde{\mathcal{V}} - \mathfrak{P}_0 (\widetilde{\mathcal{V}} \cdot \nabla \widetilde{\mathcal{V}} + (\nabla \cdot \widetilde{\mathcal{V}}) \widetilde{\mathcal{V}}) - \big( \int_0^z \nabla \cdot \widetilde{\mathcal{V}}(\mathbf{x}, s) ds \big) \partial_z \widetilde{\mathcal{V}} \Big) \mp i \Omega \mathfrak{P}_{\pm} \mathcal{V} - \nu \partial_{zz} \mathfrak{P}_{\pm} \mathcal{V} = 0.
$$
\n(2.18)

Let

<span id="page-8-1"></span> $\mathcal{V}_+ := e^{-i\Omega t} \mathfrak{P}_+ \mathcal{V} \quad \text{and} \quad \mathcal{V}_- := e^{i\Omega t} \mathfrak{P}_- \mathcal{V}.$  (2.19)

Then, for  $r \geq 0, \tau \geq 0, s \geq 0$ , and  $s \in \mathbb{Z}$ , it is straightforward to check that,

<span id="page-8-4"></span>
$$
||A^r e^{\tau A} \partial_z^s \mathcal{V}_+||^2 = ||A^r e^{\tau A} \partial_z^s \mathcal{V}_-||^2 = \frac{1}{2} ||A^r e^{\tau A} \partial_z^s \widetilde{\mathcal{V}}||^2.
$$
 (2.20)

One can derive from [\(2.18\)](#page-8-0) that

<span id="page-8-2"></span>
$$
\partial_t \mathcal{V}_{\pm} + e^{\mp i \Omega t} \mathfrak{P}_{\pm} \Big( \widetilde{\mathcal{V}} \cdot \nabla \widetilde{\mathcal{V}} + \widetilde{\mathcal{V}} \cdot \nabla \overline{\mathcal{V}} + \overline{\mathcal{V}} \cdot \nabla \widetilde{\mathcal{V}} - \mathfrak{P}_0 (\widetilde{\mathcal{V}} \cdot \nabla \widetilde{\mathcal{V}} + (\nabla \cdot \widetilde{\mathcal{V}}) \widetilde{\mathcal{V}}) - \left( \int_0^z \nabla \cdot \widetilde{\mathcal{V}}(\boldsymbol{x}, s) ds \right) \partial_z \widetilde{\mathcal{V}} \Big) - \nu \partial_{zz} \mathcal{V}_{\pm} = 0.
$$
\n(2.21)

Thanks to Lemma  $2.2$  and  $(2.15)$ , we have

$$
\begin{split}\n\mathfrak{P}_{+}(\widetilde{\mathcal{V}}\cdot\nabla\widetilde{\mathcal{V}}) &= \frac{1}{2}(\widetilde{\mathcal{V}}\cdot\nabla\widetilde{\mathcal{V}} + i\widetilde{\mathcal{V}}\cdot\nabla\widetilde{\mathcal{V}}^{\perp}) - \frac{1}{2}\mathfrak{P}_{0}\left(\widetilde{\mathcal{V}}\cdot\nabla\widetilde{\mathcal{V}} + i\widetilde{\mathcal{V}}\cdot\nabla\widetilde{\mathcal{V}}^{\perp}\right) \\
&= \frac{1}{2}\widetilde{\mathcal{V}}\cdot\nabla(\widetilde{\mathcal{V}} + i\widetilde{\mathcal{V}}^{\perp}) - \frac{1}{2}\mathfrak{P}_{0}\left(\widetilde{\mathcal{V}}\cdot\nabla(\widetilde{\mathcal{V}} + i\widetilde{\mathcal{V}}^{\perp})\right) = e^{i\Omega t}\left(\widetilde{\mathcal{V}}\cdot\nabla\mathcal{V}_{+} - \mathfrak{P}_{0}(\widetilde{\mathcal{V}}\cdot\nabla\mathcal{V}_{+})\right), \\
\mathfrak{P}_{+}(\widetilde{\mathcal{V}}\cdot\nabla\overline{\mathcal{V}}) &= \frac{1}{2}(\widetilde{\mathcal{V}}\cdot\nabla\overline{\mathcal{V}} + i\widetilde{\mathcal{V}}\cdot\nabla\overline{\mathcal{V}}^{\perp}) = \frac{1}{2}\widetilde{\mathcal{V}}\cdot\nabla(\overline{\mathcal{V}} + i\overline{\mathcal{V}}^{\perp}), \\
\mathfrak{P}_{+}(\overline{\mathcal{V}}\cdot\nabla\widetilde{\mathcal{V}}) &= \frac{1}{2}(\overline{\mathcal{V}}\cdot\nabla\widetilde{\mathcal{V}} + i\overline{\mathcal{V}}\cdot\nabla\widetilde{\mathcal{V}}^{\perp}) = e^{i\Omega t}(\overline{\mathcal{V}}\cdot\nabla\mathcal{V}_{+}), \\
\mathfrak{P}_{+}\mathfrak{P}_{0}\left(\widetilde{\mathcal{V}}\cdot\nabla\widetilde{\mathcal{V}} + (\nabla\cdot\widetilde{\mathcal{V}})\widetilde{\mathcal{V}}\right) = 0.\n\end{split}
$$

After applying integration by parts, one has

$$
\mathfrak{P}_{+}\Big((\int_{0}^{z}\nabla\cdot\widetilde{\mathcal{V}}(\boldsymbol{x},s)ds)\partial_{z}\widetilde{\mathcal{V}}\Big) = \frac{1}{2}\Big((\int_{0}^{z}\nabla\cdot\widetilde{\mathcal{V}}(\boldsymbol{x},s)ds)\partial_{z}\widetilde{\mathcal{V}} + i(\int_{0}^{z}\nabla\cdot\widetilde{\mathcal{V}}(\boldsymbol{x},s)ds)\partial_{z}\widetilde{\mathcal{V}}^{\perp}\Big) -\frac{1}{2}\mathfrak{P}_{0}\Big((\int_{0}^{z}\nabla\cdot\widetilde{\mathcal{V}}(\boldsymbol{x},s)ds)\partial_{z}\widetilde{\mathcal{V}} + i(\int_{0}^{z}\nabla\cdot\widetilde{\mathcal{V}}(\boldsymbol{x},s)ds)\partial_{z}\widetilde{\mathcal{V}}^{\perp}\Big) = e^{i\Omega t}(\int_{0}^{z}\nabla\cdot\widetilde{\mathcal{V}}(\boldsymbol{x},s)ds)\partial_{z}\mathcal{V}_{+} + e^{i\Omega t}\mathfrak{P}_{0}\Big((\nabla\cdot\widetilde{\mathcal{V}})\mathcal{V}_{+}\Big).
$$

Moreover, thanks to [\(2.15\)](#page-7-4) and [\(2.19\)](#page-8-1),  $\tilde{\mathcal{V}} = \mathcal{V}_+e^{i\Omega t} + \mathcal{V}_-e^{-i\Omega t}$ . Therefore, the  $\mathcal{V}_+$  part of [\(2.21\)](#page-8-2) can be written as

<span id="page-8-3"></span>
$$
\partial_t \mathcal{V}_+ = -e^{i\Omega t} \Big( \mathcal{V}_+ \cdot \nabla \mathcal{V}_+ - \mathfrak{P}_0 (\mathcal{V}_+ \cdot \nabla \mathcal{V}_+ + (\nabla \cdot \mathcal{V}_+) \mathcal{V}_+) - \Big( \int_0^z \nabla \cdot \mathcal{V}_+ (\boldsymbol{x}, s) ds \Big) \partial_z \mathcal{V}_+ \Big) - \Big( \overline{\mathcal{V}} \cdot \nabla \mathcal{V}_+ + \frac{1}{2} (\mathcal{V}_+ \cdot \nabla) (\overline{\mathcal{V}} + i \overline{\mathcal{V}}^\perp) \Big) + \nu \partial_{zz} \mathcal{V}_+ - e^{-2i\Omega t} \frac{1}{2} (\mathcal{V}_- \cdot \nabla) (\overline{\mathcal{V}} + i \overline{\mathcal{V}}^\perp) - e^{-i\Omega t} \Big( \mathcal{V}_- \cdot \nabla \mathcal{V}_+ - \mathfrak{P}_0 (\mathcal{V}_- \cdot \nabla \mathcal{V}_+ + (\nabla \cdot \mathcal{V}_-) \mathcal{V}_+) - \Big( \int_0^z \nabla \cdot \mathcal{V}_- (\boldsymbol{x}, s) ds \Big) \partial_z \mathcal{V}_+ \Big).
$$
\n(2.22)

Similarly, the  $\mathcal{V}_-$  part of [\(2.21\)](#page-8-2) can be written as

<span id="page-9-4"></span>
$$
\partial_t \mathcal{V}_- = -e^{-i\Omega t} \Big( \mathcal{V}_- \cdot \nabla \mathcal{V}_- - \mathfrak{P}_0 (\mathcal{V}_- \cdot \nabla \mathcal{V}_- + (\nabla \cdot \mathcal{V}_-) \mathcal{V}_-) - \Big( \int_0^z \nabla \cdot \mathcal{V}_- (\boldsymbol{x}, s) ds \Big) \partial_z \mathcal{V}_- \Big) - \Big( \overline{\mathcal{V}} \cdot \nabla \mathcal{V}_- + \frac{1}{2} (\mathcal{V}_- \cdot \nabla)(\overline{\mathcal{V}} - i \overline{\mathcal{V}}^\perp) \Big) + \nu \partial_{zz} \mathcal{V}_- - e^{2i\Omega t} \frac{1}{2} (\mathcal{V}_+ \cdot \nabla)(\overline{\mathcal{V}} - i \overline{\mathcal{V}}^\perp) - e^{i\Omega t} \Big( \mathcal{V}_+ \cdot \nabla \mathcal{V}_- - \mathfrak{P}_0 (\mathcal{V}_+ \cdot \nabla \mathcal{V}_- + (\nabla \cdot \mathcal{V}_+) \mathcal{V}_-) - \Big( \int_0^z \nabla \cdot \mathcal{V}_+ (\boldsymbol{x}, s) ds \Big) \partial_z \mathcal{V}_- \Big).
$$
\n(2.23)

In addition, [\(2.17a\)](#page-7-5) can be written as

$$
\partial_t \overline{\mathcal{V}} + \overline{\mathcal{V}} \cdot \nabla \overline{\mathcal{V}} + e^{2i\Omega t} \mathfrak{P}_0 \Big( \mathcal{V}_+ \cdot \nabla \mathcal{V}_+ + (\nabla \cdot \mathcal{V}_+) \mathcal{V}_+ \Big) + e^{-2i\Omega t} \mathfrak{P}_0 \Big( \mathcal{V}_- \cdot \nabla \mathcal{V}_- + (\nabla \cdot \mathcal{V}_-) \mathcal{V}_- \Big) + \nabla p + \mathfrak{P}_0 \Big( \mathcal{V}_+ \cdot \nabla \mathcal{V}_- + \mathcal{V}_- \cdot \nabla \mathcal{V}_+ + (\nabla \cdot \mathcal{V}_+) \mathcal{V}_- + (\nabla \cdot \mathcal{V}_-) \mathcal{V}_+ \Big) = 0.
$$

Recalling [\(2.15\)](#page-7-4) and [\(2.19\)](#page-8-1), i.e.,  $\mathcal{V}_{\pm} = e^{\mp i \Omega t} \mathfrak{P}_{\pm} \mathcal{V} = \frac{1}{2} e^{\mp i \Omega t} (\widetilde{\mathcal{V}} \pm i \widetilde{\mathcal{V}}^{\perp})$ , we rewrite the last term of the above equation as

$$
\mathfrak{P}_0(\mathcal{V}_+ \cdot \nabla \mathcal{V}_- + \mathcal{V}_- \cdot \nabla \mathcal{V}_+ + (\nabla \cdot \mathcal{V}_+) \mathcal{V}_- + (\nabla \cdot \mathcal{V}_-) \mathcal{V}_+)
$$
\n
$$
= \frac{1}{2} \mathfrak{P}_0(\widetilde{\mathcal{V}} \cdot \nabla \widetilde{\mathcal{V}} + \widetilde{\mathcal{V}}^\perp \cdot \nabla \widetilde{\mathcal{V}}^\perp + (\nabla \cdot \widetilde{\mathcal{V}}) \widetilde{\mathcal{V}} + (\nabla \cdot \widetilde{\mathcal{V}}^\perp) \widetilde{\mathcal{V}}^\perp) = \frac{1}{2} \mathfrak{P}_0(\nabla |\widetilde{\mathcal{V}}|^2) = \nabla (\frac{1}{2} \mathfrak{P}_0 |\widetilde{\mathcal{V}}|^2),
$$

which can be combined with  $\nabla p$ . Therefore, with abuse of notation, one can rewrite [\(2.17a\)](#page-7-5) as

<span id="page-9-3"></span>
$$
\partial_t \overline{\mathcal{V}} + (\overline{\mathcal{V}} \cdot \nabla \overline{\mathcal{V}}) + \nabla p + e^{2i\Omega t} \mathfrak{P}_0 \left( \mathcal{V}_+ \cdot \nabla \mathcal{V}_+ + (\nabla \cdot \mathcal{V}_+) \mathcal{V}_+ \right) + e^{-2i\Omega t} \mathfrak{P}_0 \left( \mathcal{V}_- \cdot \nabla \mathcal{V}_- + (\nabla \cdot \mathcal{V}_-) \mathcal{V}_- \right) = 0.
$$
\n(2.24)

#### <span id="page-9-2"></span>**3. Local Well-posedness**

<span id="page-9-1"></span>In sections [3.1](#page-10-0) and [3.2,](#page-12-0) below, we will establish the local well-posedness, i.e., the existence, the uniqueness, and the continuous dependency on initial data, of weak solutions to system [\(1.1\)](#page-1-0), defined as below:

**Definition 3.1.** Let  $T > 0$ ,  $r > 2$ ,  $\tau_0 > 0$ , and suppose that the initial data  $\mathcal{V}_0 \in \mathcal{S}_{r,0,\tau_0} \cap H$ . We say  $\mathcal{V}$  is a Leray-Hopf type weak solution to system  $(1.1)$  with initial and boundary conditions  $(1.2)$ – $(1.3)$  if

1) there exists  $\tau(t) > 0$ , for  $t \in [0, T]$ , such that

$$
\mathcal{V} \in L^{\infty}(0, T; \mathcal{S}_{r,0,\tau(t)}) \cap L^{2}(0, T; V \cap \mathcal{S}_{r,1,\tau(t)} \cap \mathcal{S}_{r+\frac{1}{2},0,\tau(t)}),
$$
  

$$
\partial_t \mathcal{V}, A^{r-\frac{1}{2}} e^{\tau A} \partial_t \mathcal{V} \in L^{2}(0, T; V'),
$$

- 2) system  $(1.1)$  is satisfied in the distribution sense,
- 3) and moreover, the following energy inequality holds:

$$
\|\mathcal{V}(t)\|_{r,0,\tau(t)}^2 + 2\int_0^t \Big(\nu\|\partial_z\mathcal{V}(s)\|_{r,0,\tau(s)}^2 + \|A^{r+\frac{1}{2}}e^{\tau(s)A}\mathcal{V}(s)\|^2\Big)ds \le \|\mathcal{V}_0\|_{r,0,\tau_0}^2.
$$

<span id="page-9-0"></span>The following theorem is the main result in this section.

**Theorem 3.1.** *Assume*  $V_0 \in S_{r,0,\tau_0} \cap H$  *with*  $r > 2$  *and*  $\tau_0 > 0$ *. Let*  $\Omega \in \mathbb{R}$  *be arbitrary and fixed. Then there exist a positive time*  $T > 0$  *and a positive function*  $\tau(t) > 0$  *given in* [\(3.6\)](#page-11-0) *and* [\(3.5\)](#page-10-1), *below, respectively,* 

*such that* V *is a Leray-Hopf type weak solution, as in Definition [3.1,](#page-9-1) to system [\(1.1\)](#page-1-0) with [\(1.2\)](#page-1-4) and*  $(1.3)$  *in* [0, T]. In particular,  $\tau(t)$  and T are independent of  $\Omega$ . Moreover,  $\mathcal V$  *is unique and depends continuously on the initial data, in the sense of [\(3.21\)](#page-15-1), below.*

Notice that we do not need to assume  $(2.7)$  in Theorem [3.1.](#page-9-0) Throughout the rest of this section, we assume that  $(V, p)$  satisfies  $(1.1)$ – $(1.3)$  and is smooth enough such that the following calculation makes sense. The rigid justification can be established through Galerkin approximation arguments (see, e.g., [\[23](#page-42-9)[,39](#page-43-22)]). In particular, in section [3.1,](#page-10-0) we establish the *a priori* estimates of solutions to system [\(1.1\)](#page-1-0) with [\(1.3\)](#page-1-3). In section [3.2,](#page-12-0) we finish the proof of Theorem [3.1](#page-9-0) by establishing the uniqueness and continuous dependency on initial data. In section [3.3,](#page-15-2) we show that the weak solution immediately becomes analytic in z, and the radius of analyticity in z increases as long as the solution exists.

### <span id="page-10-0"></span>**3.1.** *A Priori* **Estimates**

Direct calculation of  $\langle (1.1a), V \rangle + \langle A^r e^{\tau A}(1.1a), A^r e^{\tau A} V \rangle$ , after applying integration by parts, [\(1.1c\)](#page-1-2), and  $(1.3)$ , shows that

<span id="page-10-2"></span>
$$
\frac{1}{2} \frac{d}{dt} ||\mathcal{V}||_{r,0,\tau}^2 + \nu ||\partial_z \mathcal{V}||_{r,0,\tau}^2 - \dot{\tau} ||A^{r+\frac{1}{2}} e^{\tau A} \mathcal{V}||^2 = -\left\langle A^r e^{\tau A} (\mathcal{V} \cdot \nabla \mathcal{V}), A^r e^{\tau A} \mathcal{V} \right\rangle \n+ \left\langle A^r e^{\tau A} \left[ \left( \int_0^z \nabla \cdot \mathcal{V}(x,s) ds \right) \partial_z \mathcal{V} \right], A^r e^{\tau A} \mathcal{V} \right\rangle =: I_1 + I_2.
$$
\n(3.1)

By virtue of Lemma  $A.1$ , the Sobolev inequality, and the Hölder inequality, we have

$$
|I_1| \leq \left| \left\langle A^r e^{\tau A} (\mathcal{V} \cdot \nabla \mathcal{V}), A^r e^{\tau A} \mathcal{V} \right\rangle \right|
$$
  
\n
$$
\leq \int_0^1 C_r \left( \|A^r e^{\tau A} \mathcal{V}(z)\|_{L^2(\mathbb{T}^2)} + \|\mathcal{V}(z)\|_{L^2(\mathbb{T}^2)} \right) \|A^{r+\frac{1}{2}} e^{\tau A} \mathcal{V}(z)\|_{L^2(\mathbb{T}^2)}^2 dz
$$
  
\n
$$
\leq C_r (\|\mathcal{V}\|_{r,0,\tau} + \|\partial_z \mathcal{V}\|_{r,0,\tau}) \|A^{r+\frac{1}{2}} e^{\tau A} \mathcal{V}\|^2.
$$

Applying Lemma  $A.2$  to  $I_2$  leads to

$$
|I_2| \leq C_r ||\partial_z \mathcal{V}||_{r,0,\tau} ||A^{r+\frac{1}{2}} e^{\tau A} \mathcal{V}||^2.
$$

Thus from  $(3.1)$ , one has

<span id="page-10-3"></span>
$$
\frac{1}{2}\frac{d}{dt}\|\mathcal{V}\|_{r,0,\tau}^{2} + \nu\|\partial_{z}\mathcal{V}\|_{r,0,\tau}^{2} + \|A^{r+\frac{1}{2}}e^{\tau A}\mathcal{V}\|^{2} \leq \left(\dot{\tau} + 1 + C_{r}(\|\mathcal{V}\|_{r,0,\tau} + \|\partial_{z}\mathcal{V}\|_{r,0,\tau})\right) \times \|A^{r+\frac{1}{2}}e^{\tau A}\mathcal{V}\|^{2} \leq \left(\dot{\tau} + C_{r}(1+\|\mathcal{V}\|_{r,0,\tau}^{2} + \|\partial_{z}\mathcal{V}\|_{r,0,\tau}^{2})\right)\|A^{r+\frac{1}{2}}e^{\tau A}\mathcal{V}\|^{2}.
$$
\n(3.2)

Choose  $\tau$  such that

<span id="page-10-4"></span>
$$
\dot{\tau} + 1 + C_r(||\mathcal{V}||_{r,0,\tau} + ||\partial_z \mathcal{V}||_{r,0,\tau}) = 0.
$$
\n(3.3)

Then, one has

$$
\frac{1}{2}\frac{d}{dt}\|\mathcal{V}\|_{r,0,\tau}^2 + \nu \|\partial_z \mathcal{V}\|_{r,0,\tau}^2 + \|A^{r+\frac{1}{2}}e^{\tau A}\mathcal{V}\|^2 \le 0.
$$

For  $\mathcal{T} > 0$ , to be determined, and  $t \in [0, \mathcal{T}]$ , one has, after integrating [\(3.2\)](#page-10-3) in the t-variable,

<span id="page-10-5"></span>
$$
\|\mathcal{V}(t)\|_{r,0,\tau(t)}^2 + 2\int_0^t \left(\nu\|\partial_z\mathcal{V}(s)\|_{r,0,\tau(s)}^2 + \|A^{r+\frac{1}{2}}e^{\tau(s)A}\mathcal{V}(s)\|^2\right)ds \le \|\mathcal{V}_0\|_{r,0,\tau_0}^2. \tag{3.4}
$$

On the other hand, integrating [\(3.3\)](#page-10-4) yields

<span id="page-10-1"></span>
$$
\tau(t) = \tau_0 - t - C_r \int_0^t (||\mathcal{V}(s)||_{r,0,\tau(s)} + ||\partial_z \mathcal{V}(s)||_{r,0,\tau(s)}) ds
$$
  
\n
$$
\geq \tau_0 - (1 + C_r ||\mathcal{V}_0||_{r,0,\tau_0}) t - \frac{C_r}{\sqrt{2\nu}} ||\mathcal{V}_0||_{r,0,\tau_0} \sqrt{t}.
$$
\n(3.5)

Consider, for  $C_r > 0$  as in [\(3.5\)](#page-10-1), that

<span id="page-11-0"></span>
$$
\mathcal{T} := \left( \frac{\sqrt{\frac{C_r^2 \|\mathcal{V}_0\|_{r,0,\tau_0}^2}{2\nu} + 2\tau_0 (1 + C_r \|\mathcal{V}_0\|_{r,0,\tau_0}) - \frac{C_r \|\mathcal{V}_0\|_{r,0,\tau_0}}{\sqrt{2\nu}}}{2(1 + C_r \|\mathcal{V}_0\|_{r,0,\tau_0})} \right)^2 > 0, \tag{3.6}
$$

which solves

$$
(1 + C_r ||\mathcal{V}_0||_{r,0,\tau_0})\mathcal{T} - \frac{C_r}{\sqrt{2\nu}}||\mathcal{V}_0||_{r,0,\tau_0}\sqrt{\mathcal{T}} = \frac{\tau_0}{2}.
$$

Then one has

$$
\tau(t) \ge \tau_0/2 > 0 \quad \text{for} \quad t \in [0, T].
$$

Consequently, [\(3.4\)](#page-10-5) implies that

<span id="page-11-1"></span>
$$
\mathcal{V} \in L^{\infty}\big(0, \mathcal{T}; \mathcal{S}_{r,0,\tau(t)}\big) \cap L^{2}\big(0, \mathcal{T}; V \cap \mathcal{S}_{r,1,\tau(t)} \cap \mathcal{S}_{r+\frac{1}{2},0,\tau(t)}\big) \tag{3.7}
$$

with  $T > 0$  given as in  $(3.6)$  and  $\tau(t)$  given as in  $(3.5)$  (or equivalently  $(3.3)$ ).

Next, in order to obtain the estimate of  $\partial_t \mathcal{V}$ , testing [\(1.1a\)](#page-1-1) with  $\forall \phi \in \mathcal{V}$  (see [\(2.5\)](#page-5-2)) leads to

<span id="page-11-2"></span>
$$
\langle \partial_t \mathcal{V}, \phi \rangle + \langle \mathcal{V} \cdot \nabla \mathcal{V} - \left( \int_0^z \nabla \cdot \mathcal{V}(\mathbf{x}, s) ds \right) \partial_z \mathcal{V} + \Omega \mathcal{V}^\perp - \nu \partial_{zz} \mathcal{V}, \phi \rangle = 0. \tag{3.8}
$$

where we have substituted, thanks to [\(1.1b\)](#page-1-5) and [\(2.5\)](#page-5-2),  $\langle \nabla p, \phi \rangle = -\langle p, \nabla \cdot \phi \rangle = 0$ . Since  $r > 2$ , thanks to the Hölder inequality and the Sobolev inequality, we obtain that

$$
\langle \mathcal{V} \cdot \nabla \mathcal{V}, \phi \rangle \leq C \|\mathcal{V}\|_{L_x^{\infty} L_x^2} \|\nabla \mathcal{V}\|_{L_x^2 L_x^2} \|\phi\|_{L_x^2 L_x^{\infty}} \leq C_r \|\mathcal{V}\|_{r,0,\tau}^2 \|\phi\|_{V}
$$

and

$$
\left|\left\langle \left(\int_0^z \nabla \cdot \mathcal{V}(\boldsymbol{x},s)ds\right) \partial_z \mathcal{V}, \phi \right\rangle\right| \leq \int_{\mathbb{T}^2} \left(\int_0^1 |\nabla \cdot \mathcal{V}|dz\right) \left(\int_0^1 |\partial_z \mathcal{V}| |\phi|dz\right) dx
$$
  

$$
\leq C \int_{\mathbb{T}^2} \|\nabla \mathcal{V}\|_{L_z^2} \|\partial_z \mathcal{V}\|_{L_z^2} \|\phi\|_{L_z^2} dx \leq C \|\nabla \mathcal{V}\|_{L_x^2 L_z^2} \|\partial_z \mathcal{V}\|_{L_x^4 L_z^2} \|\phi\|_{L_x^4 L_z^2} \leq C_r \|\mathcal{V}\|_{r,1,\tau} \|\mathcal{V}\|_{r,0,\tau} \|\phi\|_{V}.
$$

After applying integration by parts, one has

 $\overline{\phantom{a}}$  $\overline{\phantom{a}}$  $\overline{\phantom{a}}$ 

$$
\left| \left\langle \Omega \mathcal{V}^{\perp} - \nu \partial_{zz} \mathcal{V}, \phi \right\rangle \right| = \left| \left\langle \Omega \mathcal{V}^{\perp}, \phi \right\rangle + \nu \left\langle \partial_z \mathcal{V}, \partial_z \phi \right\rangle \right| \leq C_{\nu, \Omega} ||\mathcal{V}||_{r, 1, \tau} ||\phi||_{V}.
$$

Therefore, one has

$$
\left|\left\langle \partial_t \mathcal{V}, \phi \right\rangle\right| \leq C_{\nu,r,\Omega}\left( \|\mathcal{V}\|_{r,0,\tau}^2 + \left(1 + \|\mathcal{V}\|_{r,0,\tau}\right) \|\mathcal{V}\|_{r,1,\tau}\right) \|\phi\|_{V}.
$$

Since  $\mathscr V$  is dense in V, one has

$$
\|\partial_t \mathcal{V}\|_{V'} = \sup_{\|\phi\|_{V}=1} \left| \left\langle \partial_t \mathcal{V}, \phi \right\rangle \right| \leq C_{\nu,r,\Omega} \left( \|\mathcal{V}\|_{r,0,\tau}^2 + (1 + \|\mathcal{V}\|_{r,0,\tau}) \|\mathcal{V}\|_{r,1,\tau} \right).
$$

Thanks to  $(3.7)$ , we have

<span id="page-11-3"></span>
$$
\partial_t \mathcal{V} \in L^2(0, \mathcal{T}; V') \quad \text{and}
$$
  

$$
\|\partial_t \mathcal{V}\|_{L^2(0, \mathcal{T}; V')} \leq C_{\nu, r, \Omega} \Big( C_{\mathcal{T}} \|\mathcal{V}\|_{L^{\infty}(0, \mathcal{T}; S_{r, 0, \tau})}^2 + (1 + \|\mathcal{V}\|_{L^{\infty}(0, \mathcal{T}; S_{r, 0, \tau})}) \|\mathcal{V}\|_{L^2(0, \mathcal{T}; S_{r, 1, \tau})} \Big) < \infty.
$$
 (3.9)

Meanwhile, for  $A^{r-\frac{1}{2}}e^{\tau A}\partial_t \mathcal{V}$ , one has, similarly as in [\(3.8\)](#page-11-2),

$$
\left\langle A^{r-\frac{1}{2}}e^{\tau A}\partial_t \mathcal{V}, \phi \right\rangle + \left\langle A^{r-\frac{1}{2}}e^{\tau A}(\mathcal{V}\cdot\nabla \mathcal{V}) - A^{r-\frac{1}{2}}e^{\tau A}\Big((\int_0^z \nabla \cdot \mathcal{V}(x, s)ds\big)\partial_z \mathcal{V}\Big) + \Omega A^{r-\frac{1}{2}}e^{\tau A}\mathcal{V}^\perp - \nu \partial_{zz}A^{r-\frac{1}{2}}e^{\tau A}\mathcal{V}, \phi \right\rangle = 0.
$$

With  $r > 2$ , thanks to Lemma [2.1,](#page-5-0) the Hölder inequality, and the Sobolev inequality, we obtain that

$$
\left| \left\langle A^{r-\frac{1}{2}} e^{\tau A} (\mathcal{V} \cdot \nabla \mathcal{V}), \phi \right\rangle \right| \leq \| A^{r-\frac{1}{2}} e^{\tau A} \mathcal{V} \cdot \nabla \mathcal{V} \|_{L_x^2 L_x^1} \|\phi\|_{L_x^2 L_x^{\infty}} \leq C_r \|\mathcal{V}\|_{r+\frac{1}{2},0,\tau} \|\mathcal{V}\|_{r,0,\tau} \|\phi\|_{V}.
$$

After applying integration by parts in the  $z$ -variable and the Hölder inequality, one has

$$
\left| \left\langle A^{r-\frac{1}{2}} e^{\tau A} \Big( \Big( \int_0^z \nabla \cdot \mathcal{V}(x, s) ds \Big) \partial_z \mathcal{V} \Big), \phi \right\rangle \right| \le \left| \left\langle A^{r-\frac{1}{2}} e^{\tau A} \Big( (\nabla \cdot \mathcal{V}) \mathcal{V} \Big), \phi \right\rangle \right|
$$
  
+  $\left| \left\langle A^{r-\frac{1}{2}} e^{\tau A} \Big( \Big( \int_0^z \nabla \cdot \mathcal{V}(x, s) ds \Big) \mathcal{V} \Big), \partial_z \phi \right\rangle \right| \le C_r ||\mathcal{V}||_{r+\frac{1}{2},0,\tau} ||\mathcal{V}||_{r,0,\tau} ||\phi||_V,$ 

and similarly,

$$
\left| \left\langle \Omega A^{r-\frac{1}{2}} e^{\tau A} \mathcal{V}^{\perp} - \nu \partial_{zz} A^{r-\frac{1}{2}} e^{\tau A} \mathcal{V}, \phi \right\rangle \right| \leq C_{\nu, \Omega} \|\mathcal{V}\|_{r, 1, \tau} \|\phi\|_{V}.
$$

Therefore, one has

$$
\left|\left\langle A^{r-\frac{1}{2}}e^{\tau A}\partial_t\mathcal{V},\phi\right\rangle\right|\leq C_{\nu,r,\Omega}\left(\|\mathcal{V}\|_{r+\frac{1}{2},0,\tau}\|\mathcal{V}\|_{r,0,\tau}+\|\mathcal{V}\|_{r,1,\tau}\right)\|\phi\|_{V}.
$$

Since  $\mathscr V$  is dense in V, one has

$$
||A^{r-\frac{1}{2}}e^{\tau A}\partial_t \mathcal{V}||_{V'} = \sup_{||\phi||_V=1} \left| \left\langle A^{r-\frac{1}{2}}e^{\tau A}\partial_t \mathcal{V}, \phi \right\rangle \right| \leq C_{\nu,r,\Omega} \left( ||\mathcal{V}||_{r+\frac{1}{2},0,\tau} ||\mathcal{V}||_{r,0,\tau} + ||\mathcal{V}||_{r,1,\tau} \right).
$$

Thanks to  $(3.7)$ , we have

<span id="page-12-1"></span>
$$
A^{r-\frac{1}{2}}e^{\tau A}\partial_t \mathcal{V} = L^2(0, \mathcal{T}; V') \quad \text{and}
$$
  

$$
||A^{r-\frac{1}{2}}e^{\tau A}\partial_t \mathcal{V}||_{L^2(0, \mathcal{T}; V')} \leq C_{\nu, r, \Omega}\Big(||\mathcal{V}||_{L^{\infty}(0, \mathcal{T}; \mathcal{S}_{r, 0, \tau})}||\mathcal{V}||_{L^2(0, \mathcal{T}; \mathcal{S}_{r+\frac{1}{2}, 0, \tau})} + ||\mathcal{V}||_{L^2(0, \mathcal{T}; \mathcal{S}_{r, 1, \tau})}\Big) < \infty
$$
<sup>(3.10)</sup>

## <span id="page-12-0"></span>**3.2. Uniqueness and Continuous Dependence on the Initial Data**

In this section, we show the uniqueness of solutions and the continuous dependence on the initial data. Let  $V_1$  and  $V_2$  be two weak solutions with initial data  $(V_0)_1$  and  $(V_0)_2$ , respectively. Assume the radius of analyticity of  $(\mathcal{V}_0)_1$  and  $(\mathcal{V}_0)_2$  is  $\tau_0$ . By virtue of  $(3.5)$  and  $(3.6)$ , for  $i = 1, 2$ , let

$$
\tau_i(t) := \tau_0 - t - C_{r,i} \int_0^t (||\mathcal{V}_i(s)||_{r,0,\tau_i(s)} + ||\partial_z \mathcal{V}_i(s)||_{r,0,\tau_i(s)}) ds,
$$
  
and 
$$
\mathcal{T}_i := \left(\frac{\sqrt{\frac{C_{r,i}^2 ||(\mathcal{V}_0)_i||_{r,0,\tau_0}^2}{2\nu} + 2\tau_0(1 + C_{r,i} ||(\mathcal{V}_0)_i||_{r,0,\tau_0})} - \frac{C_{r,i} ||(\mathcal{V}_0)_i||_{r,0,\tau_0}}{\sqrt{2\nu}}\right)^2
$$
(3.11)

such that, according to  $(3.4)$ ,  $(3.7)$ ,  $(3.9)$ , and  $(3.10)$ ,

$$
\|\mathcal{V}_i(t)\|_{r,0,\tau_i(t)}^2 + 2\int_0^t \Big(\nu\|\partial_z\mathcal{V}_i(s)\|_{r,0,\tau_i(s)}^2 + \|A^{r+\frac{1}{2}}e^{\tau_i(s)A}\mathcal{V}_i(s)\|^2\Big)ds \le \|(\mathcal{V}_0)_i\|_{r,0,\tau_{i0}}^2,
$$

for  $t \in [0, T_i]$ , and

$$
\mathcal{V}_i \in L^{\infty}\big(0, \mathcal{T}_i; \mathcal{S}_{r,0,\tau_i(t)}\big) \cap L^2\big(0, \mathcal{T}_i; V \cap \mathcal{S}_{r,1,\tau_i(t)} \cap \mathcal{S}_{r+\frac{1}{2},0,\tau_i(t)}\big),\,
$$
  

$$
\partial_t \mathcal{V}_i \quad \text{and} \quad A^{r-\frac{1}{2}} e^{\tau_i A} \partial_t \mathcal{V}_i \in L^2\big(0, \mathcal{T}_i; V'\big).
$$

We remind readers that  $C_{r,i}$ ,  $i = 1, 2$ , are independent of  $\Omega$  and  $\tau_0$ .

Let

$$
M := \max\left\{ \left\| (\mathcal{V}_0)_1 \right\|_{r,0,\tau_0}, \left\| (\mathcal{V}_0)_2 \right\|_{r,0,\tau_0} \right\}.
$$
\n(3.12)

Denote by  $\delta \mathcal{V} := \mathcal{V}_1 - \mathcal{V}_2$  and  $\delta p := p_1 - p_2$ . Let

<span id="page-13-0"></span>
$$
\widetilde{\tau}(t) := \tau_0 - t - C_r \sum_{i=1}^2 \int_0^t (||\mathcal{V}_i(s)||_{r,0,\tau_i(s)} + ||\mathcal{V}_i(s)||_{r,0,\tau_i(s)}^2 + ||\partial_z \mathcal{V}_i(s)||_{r,0,\tau_i(s)}) ds,
$$
  
and 
$$
\widetilde{\tau} := \Big(\frac{\sqrt{\frac{2C_r^2 M^2}{\nu} + 2\tau_0 \big(1 + 2C_r (M^2 + M)\big)} - \frac{\sqrt{2}C_r M}{\sqrt{\nu}}}{2\big(1 + 2C_r (M^2 + M)\big)}\Big)^2,
$$
\n
$$
(3.13)
$$

where  $C_r$  is a positive constant, to be determined later, satisfying

<span id="page-13-1"></span>
$$
C_r \ge \max\{C_{r,1}, C_{r,2}\}.\tag{3.14}
$$

In particular, [\(3.13\)](#page-13-0) and [\(3.14\)](#page-13-1) imply that  $\tilde{\tau}(t) \leq \tau_i(t)$  and  $\mathcal{T} \leq \mathcal{T}_i$  for  $i \in \{1,2\}$  and  $t \in (0,\mathcal{T}]$ . Therefore, for  $i = 1, 2,$ 

$$
\delta \mathcal{V} \quad \text{and} \quad \mathcal{V}_i \in L^{\infty}\big(0, \widetilde{T}; \mathcal{S}_{r,0,\widetilde{\tau}(t)}\big) \cap L^2\big(0, \widetilde{T}; V \cap \mathcal{S}_{r,1,\widetilde{\tau}(t)} \cap \mathcal{S}_{r+\frac{1}{2},0,\widetilde{\tau}(t)}\big),\tag{3.15}
$$

<span id="page-13-3"></span><span id="page-13-2"></span>
$$
\partial_t \delta \mathcal{V}
$$
 and  $A^{r-\frac{1}{2}} e^{\tilde{\tau}A} \partial_t \delta \mathcal{V} \in L^2(0, \tilde{T}; V'),$  (3.16)

and

$$
\|\mathcal{V}_i(t)\|_{r,0,\widetilde{\tau}(t)}^2 + 2\int_0^t \left(\nu\|\partial_z\mathcal{V}_i(s)\|_{r,0,\widetilde{\tau}(s)}^2 + \|A^{r+\frac{1}{2}}e^{\widetilde{\tau}(s)A}\mathcal{V}_i(s)\|^2\right)ds \leq M^2,
$$

for  $t \in [0, T]$ .

From system  $(1.1)$ , it is clear that

$$
\partial_t \delta \mathcal{V} + \delta \mathcal{V} \cdot \nabla \mathcal{V}_1 + \mathcal{V}_2 \cdot \nabla \delta \mathcal{V} - \Big( \int_0^z \nabla \cdot \delta \mathcal{V}(x, s) ds \Big) \partial_z \mathcal{V}_1 - \Big( \int_0^z \nabla \cdot \mathcal{V}_2(x, s) ds \Big) \partial_z \delta \mathcal{V} + \Omega \delta \mathcal{V}^\perp - \nu \partial_{zz} \delta \mathcal{V} + \nabla \delta p = 0 \quad \text{and} \quad \partial_z \delta p = 0.
$$

Notice that from [\(3.15\)](#page-13-2), one has that  $A^{r-\frac{1}{2}}e^{\tilde{\tau}A}\delta V \in L^2(0, \tilde{T}; V)$ . Thanks to [\(3.16\)](#page-13-3), similar calculation as in  $(3.1)$  leads to

<span id="page-13-4"></span>
$$
\frac{1}{2} \frac{d}{dt} \|\delta \mathcal{V}\|_{r-\frac{1}{2},0,\tilde{\tau}}^2 + \nu \|\partial_z \delta \mathcal{V}\|_{r-\frac{1}{2},0,\tilde{\tau}}^2 - \dot{\tilde{\tau}} \|A^r e^{\tilde{\tau} A} \delta \mathcal{V}\|^2
$$
\n
$$
= -\langle \delta \mathcal{V} \cdot \nabla \mathcal{V}_1 + \mathcal{V}_2 \cdot \nabla \delta \mathcal{V} - \left( \int_0^z \nabla \cdot \delta \mathcal{V}(x,s) ds \right) \partial_z \mathcal{V}_1 - \left( \int_0^z \nabla \cdot \mathcal{V}_2(x,s) ds \right) \partial_z \delta \mathcal{V}, \delta \mathcal{V} \rangle
$$
\n
$$
- \langle A^{r-\frac{1}{2}} e^{\tilde{\tau} A} (\delta \mathcal{V} \cdot \nabla \mathcal{V}_1), A^{r-\frac{1}{2}} e^{\tilde{\tau} A} \delta \mathcal{V} \rangle + \langle A^{r-\frac{1}{2}} e^{\tilde{\tau} A} \left[ \left( \int_0^z \nabla \cdot \delta \mathcal{V}(x,s) ds \right) \partial_z \mathcal{V}_1 \right], A^{r-\frac{1}{2}} e^{\tilde{\tau} A} \delta \mathcal{V} \rangle
$$
\n
$$
- \langle A^{r-\frac{1}{2}} e^{\tilde{\tau} A} (\mathcal{V}_2 \cdot \nabla \delta \mathcal{V}), A^{r-\frac{1}{2}} e^{\tilde{\tau} A} \delta \mathcal{V} \rangle + \langle A^{r-\frac{1}{2}} e^{\tilde{\tau} A} \left[ \left( \int_0^z \nabla \cdot \mathcal{V}_2(x,s) ds \right) \partial_z \delta \mathcal{V} \right], A^{r-\frac{1}{2}} e^{\tilde{\tau} A} \delta \mathcal{V} \rangle. \tag{3.17}
$$

After applying integration by parts, the Hölder inequality, the Young inequality, and the Sobolev inequality, since  $r > 2$ , one has

$$
\left| \left\langle \delta \mathcal{V} \cdot \nabla \mathcal{V}_1 + \mathcal{V}_2 \cdot \nabla \delta \mathcal{V} - \left( \int_0^z \nabla \cdot \delta \mathcal{V}(\boldsymbol{x}, s) ds \right) \partial_z \mathcal{V}_1 - \left( \int_0^z \nabla \cdot \mathcal{V}_2(\boldsymbol{x}, s) ds \right) \partial_z \delta \mathcal{V}, \delta \mathcal{V} \right\rangle \right|
$$
  
=  $\left| \left\langle \delta \mathcal{V} \cdot \nabla \mathcal{V}_1 - \left( \int_0^z \nabla \cdot \delta \mathcal{V}(\boldsymbol{x}, s) ds \right) \partial_z \mathcal{V}_1, \delta \mathcal{V} \right\rangle \right| \leq C_{r-\frac{1}{2}} ||\mathcal{V}_1||_{r,1,\tilde{r}} ||\delta \mathcal{V}||_{r-\frac{1}{2},0,\tilde{r}}^2.$ 

Thanks to Lemmas [A.1](#page-35-0) and [A.2,](#page-37-0) the Hölder inequality, the Young inequality, and the Sobolev inequality, since  $r > 2$ , one has

$$
\left| \langle A^{r-\frac{1}{2}}e^{\tilde{\tau}A}(\delta \mathcal{V} \cdot \nabla \mathcal{V}_{1}), A^{r-\frac{1}{2}}e^{\tilde{\tau}A}\delta \mathcal{V} \rangle \right|
$$
\n
$$
\leq \int_{0}^{1} C_{r-\frac{1}{2}} \Big[ (\|A^{r-\frac{1}{2}}e^{\tilde{\tau}A}\delta \mathcal{V}(z)\|_{L^{2}(\mathbb{T}^{2})} + \|\delta \mathcal{V}(z)\|_{L^{2}(\mathbb{T}^{2})}) \|A^{r}e^{\tilde{\tau}A}\mathcal{V}_{1}(z)\|_{L^{2}(\mathbb{T}^{2})} \|A^{r}e^{\tilde{\tau}A}\delta \mathcal{V}(z)\|_{L^{2}(\mathbb{T}^{2})} \right] dz
$$
\n
$$
\leq C_{r-\frac{1}{2}} \|\mathcal{V}_{1}\|_{r,1,\tilde{\tau}} (\|\delta \mathcal{V}\|_{r-\frac{1}{2},0,\tilde{\tau}}^{2} + \|A^{r}e^{\tilde{\tau}A}\delta \mathcal{V}\|_{r}^{2}),
$$
\n
$$
\left| \langle A^{r-\frac{1}{2}}e^{\tilde{\tau}A}(\mathcal{V}_{2} \cdot \nabla \delta \mathcal{V}), A^{r-\frac{1}{2}}e^{\tilde{\tau}A}\delta \mathcal{V} \rangle \right|
$$
\n
$$
\leq \int_{0}^{1} C_{r-\frac{1}{2}} \Big[ (\|A^{r-\frac{1}{2}}e^{\tilde{\tau}A}\mathcal{V}_{2}(z)\|_{L^{2}(\mathbb{T}^{2})} + \|\mathcal{V}_{2}(z)\|_{L^{2}(\mathbb{T}^{2})}) \|A^{r}e^{\tilde{\tau}A}\delta \mathcal{V}(z)\|_{L^{2}(\mathbb{T}^{2})} \|A^{r}e^{\tilde{\tau}A}\delta \mathcal{V}(z)\|_{L^{2}(\mathbb{T}^{2})} \right] dz
$$
\n
$$
\leq C_{r-\frac{1}{2}} \|\mathcal{V}_{2}\|_{r,1,\tilde{\tau}} \|A^{r}e^{\tilde{\tau}A}\delta \mathcal{V}(z)\|_{L^{2}(\mathbb{T}^{2})} \|A^{r-\frac{1}{2}}e^{\tilde{\tau}A}\delta \mathcal{V}(z)\|_{L^{2
$$

and

<span id="page-14-0"></span>
$$
\left| \left\langle A^{r-\frac{1}{2}} e^{\tilde{\tau}A} \left[ \left( \int_0^z \nabla \cdot \mathcal{V}_2(\mathbf{x}, s) ds \right) \partial_z \delta \mathcal{V} \right], A^{r-\frac{1}{2}} e^{\tilde{\tau}A} \delta \mathcal{V} \right\rangle \right|
$$
  
\n
$$
\leq C_{r-\frac{1}{2}} \| A^r e^{\tilde{\tau}A} \mathcal{V}_2 \| \| \partial_z \delta \mathcal{V} \|_{r-\frac{1}{2},0,\tilde{\tau}} \| A^r e^{\tilde{\tau}A} \delta \mathcal{V} \| \leq \frac{\nu}{2} \| \partial_z \delta \mathcal{V} \|_{r-\frac{1}{2},0,\tilde{\tau}}^2 + C_{\nu,r-\frac{1}{2}} \| \mathcal{V}_2 \|_{r,0,\tilde{\tau}}^2 \| A^r e^{\tilde{\tau}A} \delta \mathcal{V} \|^2.
$$
\n(3.18)

Consequently, combining the calculations between [\(3.17\)](#page-13-4) and [\(3.18\)](#page-14-0) yields

$$
\begin{aligned} &\frac{1}{2}\frac{d}{dt}\|\delta\mathcal{V}\|^{2}_{r-\frac{1}{2},0,\widetilde{\tau}}+\frac{1}{2}\nu\|\partial_{z}\delta\mathcal{V}\|^{2}_{r-\frac{1}{2},0,\widetilde{\tau}}\\ \leq&\Big(\dot{\widetilde{\tau}}+C_{\nu,r-\frac{1}{2}}\|\mathcal{V}_{2}\|^{2}_{r,0,\widetilde{\tau}}+C_{r-\frac{1}{2}}(\|\mathcal{V}_{1}\|_{r,1,\widetilde{\tau}}+\|\mathcal{V}_{2}\|_{r,1,\widetilde{\tau}})\Big)\|A^{r}e^{\widetilde{\tau} A}\delta\mathcal{V}\|^{2}+C_{r-\frac{1}{2}}\|\mathcal{V}_{1}\|_{r,1,\widetilde{\tau}}\|\delta\mathcal{V}\|^{2}_{r-\frac{1}{2},0,\widetilde{\tau}}. \end{aligned}
$$

In addition, from [\(3.13\)](#page-13-0), and [\(3.14\)](#page-13-1), and the fact that  $\tau_i(t) \geq \tilde{\tau}(t)$ ,  $i = 1, 2$ , one can derive that

$$
\begin{split}\n\tilde{\tau} + C_{\nu,r-\frac{1}{2}} \|\mathcal{V}_2\|_{r,0,\tilde{\tau}}^2 + C_{r-\frac{1}{2}} (\|\mathcal{V}_1\|_{r,1,\tilde{\tau}} + \|\mathcal{V}_2\|_{r,1,\tilde{\tau}}) \\
= -1 - C_r \sum_{i=1}^2 (\|\mathcal{V}_i(t)\|_{r,0,\tau_i(t)} + \|\mathcal{V}_i(t)\|_{r,0,\tau_i(t)}^2 + \|\partial_z \mathcal{V}_i(t)\|_{r,0,\tau_i(t)}) \\
&+ C_{\nu,r-\frac{1}{2}} \|\mathcal{V}_2\|_{r,0,\tilde{\tau}}^2 + C_{r-\frac{1}{2}} (\|\mathcal{V}_1\|_{r,1,\tilde{\tau}} + \|\mathcal{V}_2\|_{r,1,\tilde{\tau}}) \\
\leq & \left(\widetilde{C}_{\nu,r-\frac{1}{2}} - C_r\right) \sum_{i=1}^2 (\|\mathcal{V}_i(t)\|_{r,0,\tilde{\tau}(t)} + \|\mathcal{V}_i(t)\|_{r,0,\tilde{\tau}(t)}^2 + \|\partial_z \mathcal{V}_i(t)\|_{r,0,\tilde{\tau}(t)}) \leq 0,\n\end{split}
$$

where we have chosen

<span id="page-14-1"></span>
$$
C_r := \max\{\widetilde{C}_{\nu,r-\frac{1}{2}}, C_{r,1}, C_{r,2}\}.
$$
\n(3.19)

In conclusion, with  $C_r$  satisfying  $(3.19)$ , one has

<span id="page-14-2"></span>
$$
\frac{1}{2}\frac{d}{dt}\|\delta\mathcal{V}\|_{r-\frac{1}{2},0,\tilde{\tau}}^2 + \frac{1}{2}\nu\|\partial_z\delta\mathcal{V}\|_{r-\frac{1}{2},0,\tilde{\tau}}^2 \le C_{r-\frac{1}{2}}\|\mathcal{V}_1\|_{r,1,\tilde{\tau}}\|\delta\mathcal{V}\|_{r-\frac{1}{2},0,\tilde{\tau}}^2. \tag{3.20}
$$

Applying the Grönwall inequality to  $(3.20)$  results in

<span id="page-15-1"></span>
$$
\|\delta \mathcal{V}(t)\|_{r-\frac{1}{2},0,\tilde{\tau}(t)}^2 \le \|\delta \mathcal{V}(0)\|_{r-\frac{1}{2},0,\tau_0}^2 \exp(\int_0^t 2C_{r-\frac{1}{2}} \|\mathcal{V}_1(s)\|_{r,1,\tilde{\tau}(s)} ds)
$$
\n(3.21)

for  $t \in [0, T]$ , which establishes the continuous dependence on the initial data as well as the uniqueness of the weak solutions. This, together with section [3.1,](#page-10-0) finishes the proof of Theorem [3.1.](#page-9-0)

#### <span id="page-15-2"></span>**3.3. Instantaneous Analyticity in the** *z***-Variable**

In this section, we will show that the weak solution obtained in Theorem [3.1](#page-9-0) immediately becomes analytic in the z-variable (and thus analytic in all variables) when  $t > 0$ . Moreover, the radius of analyticity in the z-variable increases as long as the solution exists. For simplicity, we consider the even extension for  $\mathcal V$  in the z-variable, which is compatible with  $(1.3)$ , and work in the unit three-dimensional torus  $\mathbb{T}^3$  instead of D. With abuse of notations, we use V to represent both V in D and its even extension with respect to the *z*-variable in  $\mathbb{T}^3$ .

We first introduce the following notations that are only used in this subsection. For  $f \in L^2(\mathbb{T}^3)$  even with respect to the *z*-variable, we consider the following functional space

$$
\mathcal{S}_{r,s,\tau,\eta} := \left\{ f \in L^2(\mathbb{T}^3), \|f\|_{r,s,\tau,\eta} < \infty, \ f \text{ even with respect to the } z\text{-variable} \right\},\
$$

where

$$
||f||_{r,s,\tau,\eta}^2 := \sum_{k \in 2\pi\mathbb{Z}^2, k_3 \in 2\pi\mathbb{Z}} \left(1 + (|\mathbf{k}|^{2r} + |k_3|^{2s})e^{2\tau|\mathbf{k}|}e^{2\eta|k_3|}\right) |\hat{f}_{\mathbf{k},k_3}|^2
$$
  
and 
$$
\hat{f}_{\mathbf{k},k_3} := \int_{\mathbb{T}^3} e^{-i\mathbf{k} \cdot \mathbf{x} - i k_3 z} f(\mathbf{x}, z) d\mathbf{x} dz.
$$

Denote by

$$
A_h := \sqrt{-\Delta_h}, \quad A_z := \sqrt{-\partial_{zz}},
$$

subject to periodic boundary condition, defined by, in terms of the Fourier coefficients,

$$
(\widehat{A_h^r f})_{k,k_3} := |\mathbf{k}|^r \widehat{f}_{k,k_3}, \qquad (\widehat{A_z^s f})_{k,k_3} := |k_3|^s \widehat{f}_{k,k_3}, \qquad (\mathbf{k}, k_3) \in 2\pi (\mathbb{Z}^2 \times \mathbb{Z}), \ r, s \ge 0.
$$

Accordingly, one has

$$
||f||_{r,s,\tau,\eta}^2 = ||f||^2 + ||A_h^r e^{\tau A_h} e^{\eta A_z} f||^2 + ||A_z^s e^{\tau A_h} e^{\eta A_z} f||^2.
$$

<span id="page-15-0"></span>With such notations, we establish the following theorem:

**Theorem 3.2.** *Assume*  $\mathcal{V}_0 \in \mathcal{S}_{r,0,\tau_0,0}$  *with*  $r > 2$  *and*  $\tau_0 > 0$ *. Let*  $\Omega \in \mathbb{R}$  *be arbitrary and fixed. Then there exist*  $\mathcal{T} > 0$  *defined in*  $(3.24)$ ,  $\tau(t) > 0$  *given in*  $(3.23)$ *, below, and*  $\eta(t) = \frac{\nu}{2}t$ *, such that there exists a unique solution* V *to system*  $(1.1)$  *with*  $(1.2)$  *and*  $(1.3)$  *in*  $[0, T]$  *satisfying* 

$$
\mathcal{V}\in L^{\infty}\big(0,T;\mathcal{S}_{r,0,\tau(t),\eta(t)}\big)\cap L^{2}\big(0,T;\mathcal{S}_{r,1,\tau(t),\eta(t)}\big),
$$

*and depending continuously on the initial data. In particular,* V *immediately becomes analytic in all spatial variables for*  $t > 0$ .

*Remark 4.* After restricting  $V_0$  and  $V$  in  $\mathbb{T}^2 \times (0, 1)$ , the solutions in Theorem [3.2](#page-15-0) are the same to the ones in Theorem [3.1,](#page-9-0) thanks to the uniqueness of solutions. Therefore, the gain of analyticity in the z-variable of Theorem [3.2](#page-15-0) can be regarded as a property to solutions in Theorem [3.1.](#page-9-0)

*Remark 5.* Theorem [3.2](#page-15-0) states the gain of analyticity in the z-variable for solutions to system [\(1.1\)](#page-1-0). One can then apply the result from [\[23\]](#page-42-9) to study the effect of rotation on the lifespan of solutions after a initial time layer. However, in order to achieve a longer lifespan, the result from [\[23\]](#page-42-9) requests smallness of Sobolev norms in the baroclinic mode. In this paper, thanks to the effect of viscosity, we are able to

relax the condition by requiring smallness in a larger functional space. See Theorem [5.1](#page-21-0) and remark [9,](#page-22-2) below, for more details.

*Proof.* (Sketch of proof) Here we only show the *a priori* estimates. Direct calculation of

$$
\langle (1.1a), \mathcal{V} \rangle + \langle A_h^r e^{\tau A_h} e^{\eta A_z} (1.1a), A_h^r e^{\tau A_h} e^{\eta A_z} \mathcal{V} \rangle + \langle e^{\tau A_h} e^{\eta A_z} (1.1a), e^{\tau A_h} e^{\eta A_z} \mathcal{V} \rangle,
$$
 after applying integration by parts, (1.1c), and (1.3), shows that

$$
\frac{1}{2} \frac{d}{dt} ||\mathcal{V}||_{r,0,\tau,\eta}^{2} + \nu ||\partial_{z} \mathcal{V}||_{r,0,\tau,\eta}^{2} - \dot{\tau} \Big( ||A_{h}^{r+\frac{1}{2}} e^{\tau A_{h}} e^{\eta A_{z}} \mathcal{V}||^{2} + ||A_{h}^{\frac{1}{2}} e^{\tau A_{h}} e^{\eta A_{z}} \mathcal{V}||^{2} \Big) \n- \dot{\eta} \Big( ||A_{z}^{\frac{1}{2}} A_{h}^{r} e^{\tau A_{h}} e^{\eta A_{z}} \mathcal{V}||^{2} + ||A_{z}^{\frac{1}{2}} e^{\tau A_{h}} e^{\eta A_{z}} \mathcal{V}||^{2} \Big) \n+ \left\langle A_{h}^{r} e^{\tau A_{h}} e^{\eta A_{z}} (\mathcal{V} \cdot \nabla \mathcal{V}), A_{h}^{r} e^{\tau A_{h}} e^{\eta A_{z}} \mathcal{V} \right\rangle + \left\langle e^{\tau A_{h}} e^{\eta A_{z}} (\mathcal{V} \cdot \nabla \mathcal{V}), e^{\tau A_{h}} e^{\eta A_{z}} \mathcal{V} \right\rangle \n+ \left\langle A_{h}^{r} e^{\tau A_{h}} e^{\eta A_{z}} \Big( \left( \int_{0}^{z} \nabla \cdot \mathcal{V} ds \right) \partial_{z} \mathcal{V} \Big), A_{h}^{r} e^{\tau A_{h}} e^{\eta A_{z}} \mathcal{V} \right\rangle \n+ \left\langle e^{\tau A_{h}} e^{\eta A_{z}} \Big( \left( \int_{0}^{z} \nabla \cdot \mathcal{V} ds \right) \partial_{z} \mathcal{V} \Big), e^{\tau A_{h}} e^{\eta A_{z}} \mathcal{V} \right\rangle = 0.
$$

Denote by

$$
E := ||\mathcal{V}||_{r,0,\tau,\eta}^{2} = \sum_{(k,k_{3}) \in 2\pi\mathbb{Z}^{3}} \left(1 + (|\mathbf{k}|^{2r} + 1)e^{2\tau|\mathbf{k}|}e^{2\eta|\mathbf{k}_{3}|}\right) |\hat{\mathcal{V}}_{k,k_{3}}|^{2},
$$
  
\n
$$
F := ||\partial_{z} \mathcal{V}||_{r,0,\tau,\eta}^{2} = \sum_{(k,k_{3}) \in 2\pi\mathbb{Z}^{3}} |k_{3}|^{2} \left(1 + (|\mathbf{k}|^{2r} + 1)e^{2\tau|\mathbf{k}|}e^{2\eta|\mathbf{k}_{3}|}\right) |\hat{\mathcal{V}}_{k,k_{3}}|^{2},
$$
  
\n
$$
G := ||A_{h}^{r+\frac{1}{2}}e^{\tau A_{h}}e^{\eta A_{z}}\mathcal{V}||^{2} + ||A_{h}^{\frac{1}{2}}e^{\tau A_{h}}e^{\eta A_{z}}\mathcal{V}||^{2} = \sum_{(k,k_{3}) \in 2\pi\mathbb{Z}^{3}} (|\mathbf{k}|^{2r+1} + |\mathbf{k}|^{\frac{1}{2}})e^{2\tau|\mathbf{k}|}e^{2\eta|\mathbf{k}_{3}|}|\hat{\mathcal{V}}_{k,k_{3}}|^{2},
$$
  
\n
$$
H := ||A_{z}^{\frac{1}{2}}A_{h}^{r}e^{\tau A_{h}}e^{\eta A_{z}}\mathcal{V}||^{2} + ||A_{z}^{\frac{1}{2}}e^{\tau A_{h}}e^{\eta A_{z}}\mathcal{V}||^{2} = \sum_{(k,k_{3}) \in 2\pi\mathbb{Z}^{3}} (|\mathbf{k}_{3}||\mathbf{k}|^{2r} + |\mathbf{k}_{3}|)e^{2\tau|\mathbf{k}|}e^{2\eta|\mathbf{k}_{3}|}|\hat{\mathcal{V}}_{k,k_{3}}|^{2}.
$$

Observe that  $H \leq F$ . After setting  $\dot{\eta} = \frac{\nu}{2}$ , one obtains that

$$
\frac{1}{2}\frac{d}{dt}E + \frac{1}{2}\nu G - \dot{\tau}G
$$
\n
$$
+ \left\langle A_h^r e^{\tau A_h} e^{\eta A_z} (\mathcal{V} \cdot \nabla \mathcal{V}), A_h^r e^{\tau A_h} e^{\eta A_z} \mathcal{V} \right\rangle + \left\langle e^{\tau A_h} e^{\eta A_z} (\mathcal{V} \cdot \nabla \mathcal{V}), e^{\tau A_h} e^{\eta A_z} \mathcal{V} \right\rangle
$$
\n
$$
+ \left\langle A_h^r e^{\tau A_h} e^{\eta A_z} ((\int_0^z \nabla \cdot \mathcal{V} ds) \partial_z \mathcal{V}), A_h^r e^{\tau A_h} e^{\eta A_z} \mathcal{V} \right\rangle
$$
\n
$$
+ \left\langle e^{\tau A_h} e^{\eta A_z} ((\int_0^z \nabla \cdot \mathcal{V} ds) \partial_z \mathcal{V}), e^{\tau A_h} e^{\eta A_z} \mathcal{V} \right\rangle \leq 0.
$$

For the nonlinear terms, by applying similar calculations as in Lemma [A.1](#page-35-0) and Lemma [A.2](#page-37-0) (we also refer the readers to [\[23](#page-42-9)] for detailed calculations in  $\mathbb{T}^3$ ), one can obtain that

$$
\left| \left\langle A_h^r e^{\tau A_h} e^{\eta A_z} (\mathcal{V} \cdot \nabla \mathcal{V}), A_h^r e^{\tau A_h} e^{\eta A_z} \mathcal{V} \right\rangle \right| + \left| \left\langle e^{\tau A_h} e^{\eta A_z} (\mathcal{V} \cdot \nabla \mathcal{V}), e^{\tau A_h} e^{\eta A_z} \mathcal{V} \right\rangle \right| \leq C_r \left( E^{\frac{1}{2}} + F^{\frac{1}{2}} \right) G,
$$
\n
$$
\left| \left\langle A_h^r e^{\tau A_h} e^{\eta A_z} \left( \left( \int_0^z \nabla \cdot \mathcal{V} ds \right) \partial_z \mathcal{V} \right), A_h^r e^{\tau A_h} e^{\eta A_z} \mathcal{V} \right\rangle \right| \leq C_r F^{\frac{1}{2}} G,
$$

and thanks to the Young inequality,

$$
\left| \left\langle e^{\tau A_h} e^{\eta A_z} \left( \left( \int_0^z \nabla \cdot \mathcal{V} ds \right) \partial_z \mathcal{V} \right), e^{\tau A_h} e^{\eta A_z} \mathcal{V} \right\rangle \right| \leq C_r F^{\frac{1}{2}} E^{\frac{1}{2}} G^{\frac{1}{2}} \leq \frac{C_r}{\nu} E G + \frac{\nu}{4} F.
$$

Therefore, combining all the estimates above leads to

<span id="page-16-0"></span>
$$
\frac{d}{dt}E + \frac{1}{2}\nu F \le \left(\dot{\tau} + C_r(E^{\frac{1}{2}} + F^{\frac{1}{2}} + \frac{1}{\nu}E)\right)G.
$$
\n(3.22)

By taking  $\dot{\tau} + C_r (E^{\frac{1}{2}} + F^{\frac{1}{2}} + \frac{1}{\nu}E) = 0$ , one obtains

$$
E(t) + \frac{1}{2}\nu \int_0^t F(s)ds \le E(0).
$$

Integrating in time for  $\dot{\tau} + C_r (E^{\frac{1}{2}} + F^{\frac{1}{2}} + \frac{1}{\nu}E) = 0$ , we have

<span id="page-17-2"></span>
$$
\tau(t) = \tau_0 - \int_0^t C_r (E^{\frac{1}{2}}(s) + F^{\frac{1}{2}}(s) + \frac{1}{\nu}E(s))ds \ge \tau_0 - C_r \Big(E^{\frac{1}{2}}(0)(t + \sqrt{\frac{2t}{\nu}}) + E(0)\frac{t}{\nu}\Big). \tag{3.23}
$$

Since  $E(0) = ||V||_{r,0,\tau,0}^2$ , we denote by

<span id="page-17-1"></span>
$$
\mathcal{T} := \Big( \frac{\sqrt{\frac{2}{\nu}} \|\mathcal{V}\|_{r,0,\tau,0}^2 + \frac{2\tau_0}{C_r} (\frac{\|\mathcal{V}\|_{r,0,\tau,0}^2}{\nu} + \|\mathcal{V}\|_{r,0,\tau,0}) - \sqrt{\frac{2}{\nu}} \|\mathcal{V}\|_{r,0,\tau,0}}{2(\frac{\|\mathcal{V}\|_{r,0,\tau,0}^2}{\nu} + \|\mathcal{V}\|_{r,0,\tau,0})} \Big)^{\frac{1}{2}} > 0, \tag{3.24}
$$

which solves

$$
\|\mathcal{V}\|_{r,0,\tau,0}(\mathcal{T}+\sqrt{\mathcal{T}})+\frac{1}{\nu}\|\mathcal{V}\|_{r,0,\tau,0}^2\mathcal{T}=\frac{\tau_0}{2C_r}.
$$

Then one has

 $\tau(t) \geq \tau_0/2 > 0$  for  $t \in [0, T]$ .

Notice that the radius of analyticity in the z variable satisfies  $\eta = \frac{\nu}{2}t$ . Therefore, [\(3.22\)](#page-16-0) implies that

$$
\mathcal{V}\in L^{\infty}\big(0,\mathcal{T};\mathcal{S}_{r,0,\tau(t),\eta(t)}\big)\cap L^{2}\big(0,\mathcal{T};\mathcal{S}_{r,1,\tau(t),\eta(t)}\big).
$$

Based on the estimates above, one is able to show the existence, uniqueness, and continuous dependence on the initial data of the solution  $V$ . We omit the details.  $\Box$ 

## <span id="page-17-0"></span>**4. The Limit Resonant System**

In this section, we derive the formal limit resonant system, i.e., the limit system of system  $(1.1)$  (or, equivalently, system  $(2.17)$ ) as  $|\Omega| \rightarrow \infty$ , and discuss some properties of the limit resonant system. Recall that from  $(2.22)$ , we have

<span id="page-17-3"></span>
$$
\partial_t \mathcal{V}_+ = -e^{i\Omega t} \left( \underbrace{\mathcal{V}_+ \cdot \nabla \mathcal{V}_+ - \mathfrak{P}_0 (\mathcal{V}_+ \cdot \nabla \mathcal{V}_+ + (\nabla \cdot \mathcal{V}_+) \mathcal{V}_+) - (\int_0^z \nabla \cdot \mathcal{V}_+ (\mathbf{x}, s) ds) \partial_z \mathcal{V}_+}_{=: I_1} \right) - \left[ \underbrace{\left( \overline{\mathcal{V}} \cdot \nabla \mathcal{V}_+ + \frac{1}{2} (\mathcal{V}_+ \cdot \nabla)(\overline{\mathcal{V}} + i \overline{\mathcal{V}}^\perp) \right) - \nu \partial_{zz} \mathcal{V}_+}_{=: I_0} \right] - e^{-i\Omega t} \left( \underbrace{\mathcal{V}_- \cdot \nabla \mathcal{V}_+ - \mathfrak{P}_0 (\mathcal{V}_- \cdot \nabla \mathcal{V}_+ + (\nabla \cdot \mathcal{V}_-) \mathcal{V}_+) - (\int_0^z \nabla \cdot \mathcal{V}_- (\mathbf{x}, s) ds) \partial_z \mathcal{V}_+}_{=: I_{-1}} \right) - e^{-2i\Omega t} \underbrace{\frac{1}{2} (\mathcal{V}_- \cdot \nabla)(\overline{\mathcal{V}} + i \overline{\mathcal{V}}^\perp)}_{=: I_{-2}}.
$$
\n(4.1)

We can further rewrite [\(4.1\)](#page-17-3) as

$$
\partial_t \Big[ \mathcal{V}_+ - \frac{i}{\Omega} \Big( e^{i\Omega t} I_1 - e^{-i\Omega t} I_{-1} - \frac{1}{2} e^{-2i\Omega t} I_{-2} \Big) \Big] = -\frac{i}{\Omega} \Big( e^{i\Omega t} \partial_t I_1 - e^{-i\Omega t} \partial_t I_{-1} - \frac{1}{2} e^{-2i\Omega t} \partial_t I_{-2} \Big) - I_0.
$$

**73** Page 18 of [44](#page-42-1) Q. Lin et al. JMFM

Denote by the formal limits of  $\mathcal{V}_+$ ,  $\mathcal{V}_-$ , and  $\overline{\mathcal{V}}$  to be  $V_+$ ,  $V_-$ , and  $\overline{V}$ , respectively. By taking limit  $\Omega \to \infty$ , we obtain the limit resonant equation for  $\mathcal{V}_+$  is

<span id="page-18-1"></span>
$$
\partial_t V_+ = -(\overline{V} \cdot \nabla) V_+ - \frac{1}{2} (V_+ \cdot \nabla) (\overline{V} + i \overline{V}^\perp) + \nu \partial_{zz} V_+.
$$
\n(4.2)

Similarly, one has

<span id="page-18-2"></span>
$$
\partial_t V_- = -(\overline{V} \cdot \nabla) V_- - \frac{1}{2} (V_- \cdot \nabla) (\overline{V} - i \overline{V}^\perp) + \nu \partial_{zz} V_-, \tag{4.3}
$$

and

<span id="page-18-0"></span>
$$
\partial_t \overline{V} + \overline{V} \cdot \nabla \overline{V} + \nabla p = 0, \qquad \nabla \cdot \overline{V} = 0, \qquad \partial_z p = 0.
$$
 (4.4)

Notice that [\(4.4\)](#page-18-0) is nothing but the 2D Euler equations. Accordingly, we consider the initial conditions

<span id="page-18-3"></span>
$$
(\overline{V}_0, (V_+)_0, (V_-)_0) = (\overline{\mathcal{V}}_0, \frac{1}{2}(\widetilde{\mathcal{V}}_0 + i\widetilde{\mathcal{V}}_0^{\perp}), \frac{1}{2}(\widetilde{\mathcal{V}}_0 - i\widetilde{\mathcal{V}}_0^{\perp}))
$$
\n(4.5)

for equations  $(4.2)$ – $(4.4)$ . Since  $V_0$ ,  $V_0$ , and  $V_0$  are real valued, one has that  $(V_+)_0 = (V_-)_0^*, (V_+)_0 + (V_-)_0^*, (V_+)_0^*, (V_+)_0$  $(V_{-})_0 = i((V_{+})_0 - (V_{-})_0)^{\perp} = \widetilde{\mathcal{V}}_0$ , and, thanks to  $(4.4)$ ,  $\overline{V}$  is real valued. Thanks to  $(4.2)$  and  $(4.3)$ , one has

$$
\partial_t (V_+ - V_-^*) = -(\overline{V} \cdot \nabla)(V_+ - V_-^*) - \frac{1}{2} \left[ (V_+ - V_-^*) \cdot \nabla \right] (\overline{V} + i\overline{V}^\perp) + \nu \partial_{zz} (V_+ - V_-^*), \tag{4.6}
$$
\n
$$
\partial_t \left[ (V_+ + V_-) - i(V_+ - V_-)^\perp \right] = -(\overline{V} \cdot \nabla) \left[ (V_+ + V_-) - i(V_+ - V_-)^\perp \right] - \frac{1}{2}
$$
\n
$$
+ \nu \partial_{zz} \left[ (V_+ + V_-) - i(V_+ - V_-)^\perp \right]. \tag{4.7}
$$

Therefore, provided solutions exist and are well-posed, one has  $V_+ \equiv V_-^*$  and  $V_+ + V_- \equiv i(V_+ - V_-)^{\perp}$ . Let

<span id="page-18-9"></span>
$$
\widetilde{V} := V_+ + V_-\tag{4.8}
$$

Notice that, according to [\(2.19\)](#page-8-1),  $\tilde{V}$  is the formal limit of  $\mathcal{V}_+ + \mathcal{V}_- = e^{-i\Omega t} \mathfrak{P}_+ \mathcal{V} + e^{i\Omega t} \mathfrak{P}_- \mathcal{V}$ , as  $\Omega \to \infty$ . It is easy to verify that

<span id="page-18-8"></span><span id="page-18-6"></span><span id="page-18-5"></span><span id="page-18-4"></span>
$$
V_{\pm} = \frac{1}{2}(\tilde{V} \pm i\tilde{V}^{\perp}),\tag{4.9}
$$

and

$$
\partial_t \widetilde{V} + (\overline{V} \cdot \nabla) \widetilde{V} + \frac{1}{2} (\widetilde{V} \cdot \nabla \overline{V} - \widetilde{V}^{\perp} \cdot \nabla \overline{V}^{\perp}) - \nu \partial_{zz} \widetilde{V} = 0,
$$

or, thanks to  $\nabla \cdot \overline{V} = 0$ , equivalently,

$$
\partial_t \widetilde{V} + \overline{V} \cdot \nabla \widetilde{V} + \frac{1}{2} \widetilde{V}^\perp (\nabla^\perp \cdot \overline{V}) - \nu \partial_{zz} \widetilde{V} = 0.
$$
\n(4.10)

<span id="page-18-7"></span>In summary, to solve the limit equations  $(4.2)$ – $(4.4)$  with  $(4.5)$  is equivalent to solve the following equations:

$$
\partial_t \overline{V} + \overline{V} \cdot \nabla \overline{V} + \nabla p = 0,\tag{4.11a}
$$

$$
\nabla \cdot \overline{V} = 0, \qquad \partial_z p = 0,
$$
\n(4.11b)

$$
\partial_t \widetilde{V} + \overline{V} \cdot \nabla \widetilde{V} + \frac{1}{2} \widetilde{V}^\perp (\nabla^\perp \cdot \overline{V}) - \nu \partial_{zz} \widetilde{V} = 0,
$$
\n(4.11c)

$$
\partial_z \widetilde{V}\big|_{z=0,1} = 0,
$$
  $\overline{V}(0) = \overline{\mathcal{V}}_0,$  and  $\widetilde{V}(0)$   
=  $\widetilde{\mathcal{V}}_0.$  (4.11d)

Notice that, thanks to our choice of  $\overline{V}_0$  and  $\widetilde{V}_0$ , one has  $\mathfrak{P}_0\overline{V} = \overline{V}$  and  $\mathfrak{P}_0\widetilde{V} = 0$ . In addition, [\(4.11a\)](#page-18-4)– [\(4.11b\)](#page-18-5) is the 2D Euler system, and [\(4.11c\)](#page-18-6) is a linear transport equation with a stretching term and vertical dissipation. In the rest of this section, we summarize the well-posedness theory of [\(4.11\)](#page-18-7).

#### **4.1. Well-posedness Theory of [\(4.11a\)](#page-18-4) and [\(4.11b\)](#page-18-5)**

The global well-posedness of solutions to the 2D Euler system  $(4.11a)$ – $(4.11b)$  in Sobolev spaces  $H^r(\mathbb{T}^2)$  =  $\mathcal{S}_{r,0,0}$  with  $r > 3$  is a classical result (see, e.g., [\[7](#page-42-21)]). Moreover, from equation (3.84) in [7], for  $r > 3$ , we have

<span id="page-19-0"></span>
$$
\frac{d}{dt} \|\overline{V}\|_{r,0,0} \le C_r \|\overline{V}\|_{r,0,0} (1 + \ln^+ \|\overline{V}\|_{r,0,0}).
$$
\n(4.12)

Let  $\|\overline{V}_0\|_{r,0,0} \leq M$  for some  $M \geq 0$ . Denote by  $W(t) := \|\overline{V}(t)\|_{r,0,0} + e$ . Thanks to  $\ln^+ x + 1 \leq 2 \ln(x+e)$ , from  $(4.12)$ , we have

$$
\frac{d}{dt}W \le C_r W \ln W.
$$

Therefore, one can obtain that

<span id="page-19-1"></span>
$$
\|\overline{V}(t)\|_{r,0,0} \le W(t) \le W(0)^{e^{C_r t}} = (\|\overline{V}_0\|_{r,0,0} + e)^{e^{C_r t}} \le (M+e)^{e^{C_r t}} =: \theta_{M,r}(t). \tag{4.13}
$$

The authors in [\[40\]](#page-43-20) proved the global existence of solutions to system  $(4.11a)$ – $(4.11b)$  for initial data in the space of analytic functions. For completion, we state it here, with slight modifications to meet our settings. See also [\[23\]](#page-42-9).

<span id="page-19-2"></span>**Proposition 4.1.** *Assume*  $\overline{V}_0 \in \mathcal{S} \cap \mathcal{S}_{r,0,\tau_0}$  *with*  $r > 3$  *and*  $\tau_0 > 0$ *, and suppose that*  $\|\overline{V}_0\|_{r,0,\tau_0} \leq M$  *for some*  $M \geq 0$ *. Let* 

$$
\tau(t) := \tau_0 \exp\Big(-C_r \int_0^t h(s)ds\Big),\,
$$

*where*

$$
h^{2}(t) := \|\overline{V}_{0}\|_{r,0,\tau_{0}}^{2} + C_{r} \int_{0}^{t} \theta_{M,r}^{3}(s) ds,
$$

*with*  $\theta_{M,r}(t)$  *defined in [\(4.13\)](#page-19-1). Then for any given time*  $T > 0$ *, there exists a unique solution* 

$$
\overline{V} \in L^{\infty}(0,T; \mathcal{S} \cap \mathcal{S}_{r,0,\tau(t)})
$$

*to system [\(4.11a\)](#page-18-4)*–[\(4.11b\)](#page-18-5). Moreover, there exist constants  $C_M > 1$  and  $C_r > 1$  such that

$$
\|\overline{V}(t)\|_{r,0,\tau(t)}^2 \leq h^2(t) \leq C_M^{\exp(C_r t)}.
$$

*The solution is continuously depending on the initial data.*

### **4.2. Global Well-posedness of System [\(4.11\)](#page-18-7)**

<span id="page-19-4"></span>In this subsection, we establish the global well-posedness of limit resonant system [\(4.11\)](#page-18-7) in both Sobolev spaces  $S_{r,s,0}$  and analytic-Sobolev spaces  $S_{r,s,\tau}$ .

**Proposition 4.2.** Let  $r > 2$  and  $s \in \{0,1\}$ . Assume that  $\overline{V}_0 \in S \cap S_{r+1,0,0}$  and  $\widetilde{V}_0 \in S \cap S_{r,s,0}$ . Let  $M \geq 0$  be the constant such that  $\|\overline{V}_0\|_{r+1,0,0} \leq M$ . Then there exists a function  $K(t) := C_M^{\exp(C_r t)}$  with *constants*  $C_M > 1$  *and*  $C_r > 1$ *, such that for any given time*  $T > 0$ *, there exists a unique solution*  $(\overline{V}, \widetilde{V}) \in L^{\infty}(0, T; \mathcal{S} \cap \mathcal{S}_{r+1,0,0}) \times L^{\infty}(0, T; \mathcal{S} \cap \mathcal{S}_{r,s,0})$  of system [\(4.11\)](#page-18-7), which satisfies

<span id="page-19-3"></span>
$$
\|\overline{V}(t)\|_{r+1,0,0} \le K(t) \qquad and \qquad \|\widetilde{V}(t)\|_{r,s,0}^2 + 2\nu \int_0^t \|\partial_z \widetilde{V}(\xi)\|_{r,s,0}^2 d\xi \le \|\widetilde{V}_0\|_{r,s,0}^2 e^{\int_0^t K(s) ds}.\tag{4.14}
$$

*On the other hand, suppose that*  $\overline{V}_0 \in S \cap S_{r+1,0,\tau_0}$  *and*  $\widetilde{V}_0 \in S \cap S_{r,s,\tau_0}$  *with*  $\tau_0 > 0$ *, and that*  $\|\overline{V}_0\|_{r+1,0,\tau_0} \leq$ M*. Let*

<span id="page-19-5"></span>
$$
\tau(t) := \tau_0 \exp(-\int_0^t K(s)ds).
$$
\n(4.15)

*Then for any given time*  $T > 0$ *, there exists a unique solution*  $(\overline{V}, \widetilde{V}) \in L^{\infty}(0, T; S \cap S_{r+1,0,\tau}) \times$  $L^{\infty}(0, T; \mathcal{S} \cap \mathcal{S}_{r,s,\tau})$  *of system [\(4.11\)](#page-18-7)* such that

<span id="page-20-3"></span>
$$
\|\overline{V}(t)\|_{r+1,0,\tau(t)} \le K(t) \quad \text{and} \quad \|\widetilde{V}(t)\|_{r,s,\tau(t)}^2 + 2\nu \int_0^t \|\partial_z \widetilde{V}(\xi)\|_{r,s,\tau(\xi)}^2 d\xi \le \|\widetilde{V}_0\|_{r,s,\tau_0}^2 e^{\int_0^t K(s) \, ds}.\tag{4.16}
$$

*The solutions continuously depend on the initial data.*

*Proof.* (Sketch of proof) We will consider the case when s = 1 and only show the *a priori* estimates. The construction of solutions, uniqueness, and continuous dependency of solutions on initial data, as well as the case when  $s = 0$ , are left to readers as exercises. The global well-posedness of the 2D Euler equations in Sobolev spaces and corresponding growth estimate have been reviewed in the previous subsection. From [\(4.13\)](#page-19-1), we obtain that

<span id="page-20-0"></span>
$$
\|\overline{V}\|_{r+1,0,0} \le K_1(t) \tag{4.17}
$$

for some function  $K_1(t) := C_{M,1}^{\exp(C_{r,1}t)}$  with some constants  $C_{M,1}, C_{r,1} > 1$ .

Denote by  $\mathfrak I$  the identity map. For the growth of  $||V||_{H^r}$ , after calculating  $2\langle (4.11c),(\mathfrak{I}-\partial_{zz})V\rangle +$  $2\langle A^r(4.11c),(\mathcal{I}-\partial_{zz})A^r\widetilde{V}\rangle$  and applying integration by parts to the resultant, one has, thanks to  $\partial_z\overline{V}=0$ ,  $\nabla \cdot \overline{V} = 0$ , and  $r > \frac{5}{2}$ , for some constant  $C_{r,s} > 0$ ,

$$
\frac{d}{dt} \|\widetilde{V}\|_{r,1,0}^2 + 2\nu \|\partial_z \widetilde{V}\|_{r,1,0}^2 \le C_{r,s} \|\overline{V}\|_{r+1,0,0} \|\widetilde{V}\|_{r,1,0}^2. \tag{4.18}
$$

After applying the Grönwall inequality to the above, by virtue of  $(4.17)$ , we obtain

<span id="page-20-2"></span>
$$
\|\widetilde{V}(t)\|_{r,1,0}^2 + 2\nu \int_0^t \|\partial_z \widetilde{V}(\xi)\|_{r,1,0}^2 d\xi \le \|\widetilde{V}_0\|_{r,1,0}^2 \exp\left(C_{r,s} \int_0^t K_1(\xi) d\xi\right).
$$
\n(4.19)

On the other hand, the global well-posedness of the 2D Euler equations in the space of analytic functions and the corresponding growth estimate are summarized in Proposition [4.1.](#page-19-2) We can first choose some suitable function  $K_2(t) := C_{M,2}^{\exp(C_{r,2}t)}$ , with  $C_{M,2}, C_{r,2} > 1$ , such that  $\|\overline{V}(t)\|_{r+1,0,\tau_E(t)} \le K_2(t)$  with  $\tau_E(t) := \tau_0 \exp(-\int_0^t K_2(s)ds).$ 

Let  $\tau = \tau(t)$  to be determined. For  $\tilde{V}$ , after calculating  $\langle (4.11c),(\mathcal{I} - \partial_{zz})\tilde{V} \rangle + \langle A^r e^{\tau A}(4.11c),(\mathcal{I} - \partial_{zz})\tilde{V} \rangle$  $\partial_{zz}A^r e^{\tau A} \widetilde{V}$  and applying integration by parts, the Hölder inequality, the Sobolev inequality, Lemma [2.1,](#page-5-0) and Lemma [A.4](#page-39-0) to the resultant, since  $r > 2$ , one has, for some constant  $C_{r,a} > 0$ ,

<span id="page-20-1"></span>
$$
\frac{1}{2}\frac{d}{dt}\|\widetilde{V}\|_{r,1,\tau}^{2} + \nu\|\partial_{z}\widetilde{V}\|_{r,1,\tau}^{2} - \dot{\tau}\left(\|A^{r+\frac{1}{2}}e^{\tau A}\widetilde{V}\|^{2} + \|A^{r+\frac{1}{2}}e^{\tau A}\partial_{z}\widetilde{V}\|^{2}\right) \n= -\langle \overline{V}\cdot\nabla\widetilde{V},\widetilde{V}\rangle - \frac{1}{2}\langle(\nabla^{\perp}\cdot\overline{V})\widetilde{V}^{\perp},\widetilde{V}\rangle - \langle \overline{V}\cdot\nabla\partial_{z}\widetilde{V},\partial_{z}\widetilde{V}\rangle - \frac{1}{2}\langle(\nabla^{\perp}\cdot\overline{V})\partial_{z}\widetilde{V}^{\perp},\partial_{z}\widetilde{V}\rangle \n- \langle A^{r}e^{\tau A}(\overline{V}\cdot\nabla\widetilde{V}),A^{r}e^{\tau A}\widetilde{V}\rangle - \frac{1}{2}\langle A^{r}e^{\tau A}\Big((\nabla^{\perp}\cdot\overline{V})\partial_{z}\widetilde{V}^{\perp}\Big),A^{r}e^{\tau A}\widetilde{V}\rangle \n- \langle A^{r}e^{\tau A}(\overline{V}\cdot\nabla\partial_{z}\widetilde{V}),A^{r}e^{\tau A}\partial_{z}\widetilde{V}\rangle - \frac{1}{2}\langle A^{r}e^{\tau A}\Big((\nabla^{\perp}\cdot\overline{V})\partial_{z}\widetilde{V}^{\perp}\Big),A^{r}e^{\tau A}\partial_{z}\widetilde{V}\rangle \n= -\Big(\langle A^{r}e^{\tau A}(\overline{V}\cdot\nabla\widetilde{V}),A^{r}e^{\tau A}\widetilde{V}\rangle - \langle \overline{V}\cdot\nabla A^{r}e^{\tau A}\widetilde{V},A^{r}e^{\tau A}\widetilde{V}\rangle \Big) \n= 0 \n- \Big(\langle A^{r}e^{\tau A}(\overline{V}\cdot\nabla\partial_{z}\widetilde{V}),A^{r}e^{\tau A}\partial_{z}\widetilde{V}\rangle - \langle \overline{V}\cdot\nabla A^{r}e^{\tau A}\partial_{z}\widetilde{V},A^{r}e
$$

Now, let

<span id="page-21-4"></span>
$$
K(t) := \max\{(1 + C_{r,s})K_1(t), (1 + C_{r,a})K_2(t)\} \quad \text{and} \quad \tau = \tau(t) := \tau_0 \exp\left(-\int_0^t K(s) \, ds\right). \tag{4.21}
$$

Then  $\tau(t)$  satisfies

$$
\tau(t) \leq \tau_E(t) \quad \text{and} \quad \dot{\tau} + C_{r,a}\tau \|\overline{V}\|_{r+1,0,\tau} \leq \dot{\tau} + C_{r,a}\tau \|\overline{V}\|_{r+1,0,\tau_E} \leq \dot{\tau} + C_{r,a}\tau K_2 \leq 0.
$$

Therefore,

<span id="page-21-2"></span>
$$
\|\overline{V}(t)\|_{r+1,0,\tau(t)} \le \|\overline{V}(t)\|_{r+1,0,\tau_E(t)} \le K_2(t) \le K(t),\tag{4.22}
$$

and, after applying the Grönwall inequality to  $(4.20)$ , we have

<span id="page-21-3"></span>
$$
\begin{split} \|\widetilde{V}(t)\|_{r,1,\tau(t)}^2 + 2\nu \int_0^t \|\partial_z \widetilde{V}(\xi)\|_{r,1,\tau(\xi)}^2 d\xi &\leq \|\widetilde{V}_0\|_{r,1,\tau_0}^2 \exp\Big(\int_0^t C_{r,a} \|\overline{V}(\xi)\|_{r+1,0,\tau(\xi)} d\xi\Big) \\ &\leq \|\widetilde{V}_0\|_{r,1,\tau_0}^2 e^{\int_0^t C_{r,a} K_2(s) ds} \leq \|\widetilde{V}_0\|_{r,1,\tau_0}^2 e^{\int_0^t K(s) ds} . \end{split} \tag{4.23}
$$

Consequently, according to  $(4.17)$ ,  $(4.19)$ ,  $(4.22)$ , and  $(4.23)$ , K and  $\tau$  as in  $(4.21)$  verify  $(4.14)$  and  $(4.16)$ .  $\Box$ 

*Remark 6.* From Proposition [4.2,](#page-19-4) one can see that the growth of  $\|\overline{V}(t)\|_{r+1,0,0}$  and  $\|\overline{V}(t)\|_{r+1,0,\tau(t)}$  are double exponential in time, while the growth of  $\|\widetilde{V}(t)\|_{r,s,0}$  and  $\|\widetilde{V}(t)\|_{r,s,\tau(t)}$  are triple exponential in time.

*Remark 7.* Thanks to  $(4.9)$ , similarly as in  $(2.20)$ , we have

$$
||V_{+}||_{r,s,\tau}^{2} = ||V_{-}||_{r,s,\tau}^{2} = \frac{1}{2} ||\widetilde{V}||_{r,s,\tau}^{2},
$$

<span id="page-21-5"></span>whose growths are also triple exponential.

*Remark 8.* Proposition [4.2](#page-19-4) is for the general initial data. However, by considering special solutions to the 2D Euler equations, one has the following:

- Supposed that  $\overline{V}$  is uniformly-in-time bounded in  $\mathcal{S}_{r+1,0,\tau}$ , i.e.,  $\sup_{0\leq t\leq\infty} \|\overline{V}(t)\|_{r+1,0,\tau} \leq C_{M,r}$  for some positive constant  $C_{M,r}$ , then one can control the growth of  $\|\widetilde{V}(t)\|_{r,1,\tau}$  by one exponential in time.
- Supposed that  $\sup_{0\leq t<\infty} \|\overline{V}(t)\|_{r+1,0,\tau} \leq \frac{\nu}{4C_{r,\alpha}}$  is small enough, by applying the Poincaré inequality and with  $\tau$  chosen suitably, from  $(4.20)$  one can derive that

$$
\frac{d}{dt} \|\widetilde{V}\|_{r,1,\tau}^2 + \frac{1}{2}\nu \|\partial_z \widetilde{V}\|_{r,1,\tau}^2 \leq -\nu \|\widetilde{V}\|_{r,1,\tau}^2.
$$

After applying the Grönwall inequality to the above, we obtain

$$
\|\widetilde{V}(t)\|_{r,1,\tau(t)}^2 e^{\nu t} + \frac{1}{2}\nu \int_0^t \|\partial_z \widetilde{V}(\xi)\|_{r,1,\tau(\xi)}^2 e^{\nu \xi} d\xi \le \|\widetilde{V}_0\|_{r,1,\tau_0}^2.
$$

In particular, the estimate above holds when  $\overline{V} \equiv 0$ , i.e., zero solutions to the 2D Euler equations.

## <span id="page-21-1"></span>**5. Effect of Fast Rotation**

<span id="page-21-0"></span>In this section, we investigate the effect of rotation on the lifespan  $\mathcal T$  of solutions to system [\(1.1\)](#page-1-0). We show that the existing time of the solution in  $\mathcal{S}_{r,0,\tau(t)}$  can be prolonged for large  $|\Omega|$  provided that the Sobolev norm  $||V_0||_{\frac{5}{2}+\delta,1,0}$  is small, while the analytic-Sobolev norm  $||V_0||_{r,0,\tau_0}$  can be large. Such initial data is referred to as "well-prepared" initial data.

**73** Page 22 of [44](#page-42-1) Q. Lin et al. JMFM

**Theorem 5.1.** *Let*  $\delta \in (0, \frac{1}{2})$  *be a constant. Let*  $|\Omega| \geq |\Omega_0| > 1$  *and*  $|\Omega_0|$  *be large enough such that condition*  $(5.3)$  *below holds. Assume*  $\overline{V}_0 \in S \cap S_{r+3,0,\tau_0}$ ,  $\widetilde{V}_0 \in S \cap S_{r+2,0,\tau_0} \cap S_{r+1,1,\tau_0}$  *with*  $r > 2$  *and*  $\tau_0 > 0$ *. Let* M ≥ 0 *be such that*

<span id="page-22-5"></span>
$$
\|\overline{\mathcal{V}}_0\|_{r+3,0,\tau_0}^2 + \|\widetilde{\mathcal{V}}_0\|_{r+2,0,\tau_0}^2 + \|\widetilde{\mathcal{V}}_0\|_{r+1,1,\tau_0}^2 \le M,\tag{5.1}
$$

*and*

<span id="page-22-4"></span>
$$
\|\widetilde{\mathcal{V}}_0\|_{\frac{3}{2}+\delta,0,0} \le \frac{M}{|\Omega_0|^{1/2}}.\tag{5.2}
$$

*Then there exists a time*  $\mathcal{T} = \mathcal{T}(\tau_0, |\Omega_0|, M, r, \nu)$  *satisfying* 

<span id="page-22-3"></span>
$$
\mathcal{T} = \frac{1}{C_{\tau_0, M, r}} \log \left[ e^{-C_{\tau_0, M, r}} \log \left[ \log \left[ C_{\tau_0, M, r, \nu} \log \left( C_{\tau_0, M, r, \nu} |\Omega_0| \right) \right] \right] \right] > 0, \tag{5.3}
$$

*for some positive constant*  $C_{\tau_0,M,r,\nu} > 0$  *depending only on*  $\tau_0, M$ *, and* r*, such that the unique solution* V *obtained in Theorem [3.1](#page-9-0) satisfies*

<span id="page-22-6"></span>
$$
\mathcal{V} \in L^{\infty}(0, T; \mathcal{S} \cap \mathcal{S}_{r, 0, \tau(t)}), \tag{5.4}
$$

with  $\tau(t) > 0$ ,  $t \in [0, T]$ *, satisfying [\(5.38\)](#page-31-0), below. In particular, from [\(5.3\)](#page-22-3),*  $T \to \infty$  *as*  $|\Omega_0|^{1/2} \to \infty$ *, for any fixed* ν*.*

<span id="page-22-2"></span>*Remark 9.* Recall that the result in [\[23\]](#page-42-9) requires the initial baroclinic mode  $V_0$  to be small in the  $H^{3+\delta}$ space instead of [\(5.2\)](#page-22-4) in Theorem [5.1.](#page-21-0) This relaxation on the requirement of  $\tilde{V}_0$  is due to the vertical viscosity.

In Theorem [5.1,](#page-21-0) we consider general initial data  $\overline{V}_0$  for the barotropic mode, where the vertical viscosity helps relax the requirement on the initial baroclinic mode, but does not help prolong the lifespan. By virtue of Remark [8,](#page-21-5) when the solution  $\overline{V}$  to the 2D Euler equations with initial condition  $\overline{V}_0$  satisfies certain conditions, the smallness condition  $(5.2)$  can be relaxed and the result  $(5.3)$  can be improved. The following theorem is the summary of these results:

<span id="page-22-1"></span>**Theorem 5.2.** With the same assumptions as in Theorem [5.1,](#page-21-0) let  $\overline{V}(t)$  be the solution to the 2D Euler *equations with initial condition*  $\overline{V}_0 = \overline{V}_0$ *. Then* 

- (i) if  $\|\overline{V}(t)\|_{r+3,0,\tau(t)} \leq C_{M,r}$ , the result [\(5.3\)](#page-22-3) can be improved to  $\mathcal{T} = \frac{1}{C_{\tau_0,M,r,\nu}} \log(\log(|\Omega_0|)),$
- (ii) *if*  $\|\overline{V}(t)\|_{r+3,0,\tau(t)} \leq \frac{\nu}{4C_{r,\alpha}}$  *which is small enough, then* [\(5.2\)](#page-22-4) can be relaxed and replaced by  $\|\widetilde{\mathcal{V}}_0\|_{\frac{3}{2}+\delta,0,0} \leq \frac{\tau_0}{C_{r,\nu,M}}$ *, and [\(5.3\)](#page-22-3) can be improved to*  $\mathcal{T} = \frac{1}{C_{\tau_0,M,r,\nu}} \log(|\Omega_0|)$ *;*
- (iii) *finally, if the initial condition satisfies*  $\|\overline{\mathcal{V}}_0\|_{r+3,0,\tau_0} \leq \frac{M}{|\Omega_0|}$ , [\(5.2\)](#page-22-4) can be relaxed and replaced by  $\|\widetilde{\mathcal{V}}_0\|_{\frac{3}{2}+\delta,0,0} \leq \frac{\tau_0}{C_{r,\nu,M}}, \text{ and } (5.3) \text{ can be improved to } \mathcal{T} = \frac{|\Omega_0|^{\frac{1}{2}}}{C_{\tau_0,M,r,\nu}}.$  $\|\widetilde{\mathcal{V}}_0\|_{\frac{3}{2}+\delta,0,0} \leq \frac{\tau_0}{C_{r,\nu,M}}, \text{ and } (5.3) \text{ can be improved to } \mathcal{T} = \frac{|\Omega_0|^{\frac{1}{2}}}{C_{\tau_0,M,r,\nu}}.$  $\|\widetilde{\mathcal{V}}_0\|_{\frac{3}{2}+\delta,0,0} \leq \frac{\tau_0}{C_{r,\nu,M}}, \text{ and } (5.3) \text{ can be improved to } \mathcal{T} = \frac{|\Omega_0|^{\frac{1}{2}}}{C_{\tau_0,M,r,\nu}}.$

*Remark 10.* Compared to [\[23](#page-42-9)], the main improvement in Theorem [5.1](#page-21-0) is that the initial data is analytic in the horizontal variables but only  $L^2$  in the vertical variable. The main improvements in Theorem [5.2](#page-22-1) are points (ii) and (iii), where the smallness assumption does not depend on  $\Omega_0$ , and the lifespan is growing faster with respect to  $\Omega_0$ . For more details, we refer readers to R3 and R4 in the introduction (pages 2 and 3).

In this section, we focus on equations  $(2.22)-(2.24)$  $(2.22)-(2.24)$  $(2.22)-(2.24)$ , which are equivalent to system  $(1.1)$ . To prove Theorem [5.1,](#page-23-0) in section 5.1, we rewrite  $(2.22)$ – $(2.24)$  as the perturbation of  $(4.2)$ – $(4.4)$ . In section [5.2,](#page-23-1) we establish a series of *a priori* estimates on the solutions to the perturbation system. This together with Proposition [4.2](#page-19-4) will finish the proof of Theorem [5.1.](#page-21-0) In section [5.3,](#page-31-1) the proof of Theorem [5.2](#page-22-1) is provided.

<span id="page-22-0"></span>*Remark 11.* In this section, we only focus on the long-time existence of the weak solution. By virtue of Theorem [3.2,](#page-15-0) the weak solution is analytic in all spatial variables.

#### <span id="page-23-0"></span>**5.1. The Perturbation System**

Denote by

<span id="page-23-5"></span><span id="page-23-2"></span>
$$
\overline{\phi} := \overline{\mathcal{V}} - \overline{V} \quad \text{and} \quad \phi_{\pm} := \mathcal{V}_{\pm} - V_{\pm}.
$$
 (5.5)

Calculating the difference between  $(2.22)$ ,  $(2.23)$ ,  $(2.24)$  and  $(4.2)$ ,  $(4.3)$ ,  $(4.4)$ , respectively, leads to

$$
\partial_{t}\phi_{+} + \overline{\phi} \cdot \nabla V_{+} + \overline{\phi} \cdot \nabla \phi_{+} + \overline{V} \cdot \nabla \phi_{+} + \frac{1}{2}(\phi_{+} \cdot \nabla)(\overline{V} + i\overline{V}^{+}) + \frac{1}{2}(\phi_{+} \cdot \nabla)(\overline{\phi} + i\overline{\phi}^{+}) \n+ \frac{1}{2}(V_{+} \cdot \nabla)(\overline{\phi} + i\overline{\phi}^{+}) - \nu \partial_{zz}\phi_{+} + e^{i\Omega t}\Big(Q_{1,+,+} - \mathfrak{P}_{0}Q_{1,+,+} - \mathfrak{P}_{0}Q_{2,+,+} - Q_{3,+,+}\Big) \n+ e^{-i\Omega t}\Big(Q_{1,-,+} - \mathfrak{P}_{0}Q_{1,-,+} - \mathfrak{P}_{0}Q_{2,-,+} - Q_{3,-,+}\Big) + e^{-2i\Omega t}Q_{4,-,+} = 0, \qquad (5.6)
$$
\n
$$

$$

where

$$
Q_{1,\pm,\mp} := \phi_{\pm} \cdot \nabla V_{\mp} + \phi_{\pm} \cdot \nabla \phi_{\mp} + V_{\pm} \cdot \nabla \phi_{\mp} + V_{\pm} \cdot \nabla V_{\mp},
$$
  
\n
$$
Q_{2,\pm,\mp} := (\nabla \cdot \phi_{\pm})V_{\mp} + (\nabla \cdot \phi_{\pm})\phi_{\mp} + (\nabla \cdot V_{\pm})\phi_{\mp} + (\nabla \cdot V_{\pm})V_{\mp},
$$
  
\n
$$
Q_{3,\pm,\mp} := \left(\int_0^z \nabla \cdot \phi_{\pm}(\mathbf{x},s)ds\right) \partial_z V_{\mp} + \left(\int_0^z \nabla \cdot \phi_{\pm}(\mathbf{x},s)ds\right) \partial_z \phi_{\mp} + \left(\int_0^z \nabla \cdot V_{\pm}(\mathbf{x},s)ds\right) \partial_z V_{\mp},
$$
  
\n
$$
Q_{4,\pm,\mp} := \frac{1}{2} \left[ (\phi_{\pm} \cdot \nabla)(\overline{V} \mp i\overline{V}^{\perp}) + (\phi_{\pm} \cdot \nabla)(\overline{\phi} \mp i\overline{\phi}^{\perp}) + (V_{\pm} \cdot \nabla)(\overline{V} \mp i\overline{V}^{\perp}) \right].
$$

Recalling that  $(\overline{V}, V_{\pm})$  and  $(\overline{V}, V_{\pm})$  are complemented with the same initial data. Hence, we have

<span id="page-23-4"></span><span id="page-23-3"></span>
$$
\overline{\phi}|_{t=0} = 0 \quad \text{and} \quad \phi_{\pm}|_{t=0} = 0. \tag{5.8}
$$

#### <span id="page-23-1"></span>**5.2. Proof of Theorem [5.1](#page-21-0)**

In this subsection, we prove Theorem [5.1.](#page-21-0) Thanks to Proposition [4.2,](#page-19-4) for any given  $\mathcal{T} \in (0,\infty)$ , let  $V_{\pm}$  and  $\overline{V}$  be the global solution to equations  $(4.2)-(4.4)$  $(4.2)-(4.4)$  $(4.2)-(4.4)$  in  $L^{\infty}(0, \mathcal{T}; \mathcal{S}\cap\mathcal{S}_{r+2,1,\tau(t)})$  and  $L^{\infty}(0, \mathcal{T}; \mathcal{S}\cap\mathcal{S}_{r+3,0,\tau(t)})$ for some  $\tau = \tau(t), t \in [0, T)$ , respectively. Next, we provide the energy estimate in the space  $\mathcal{S}_{r,0,\tau(t)}$  for equations  $(5.6)$ – $(5.7)$ .

After applying similar calculation as in  $(3.1)$ , we obtain that

$$
\frac{1}{2}\frac{d}{dt}(\|\phi_{+}\|_{r,0,\tau}^{2} + \|\phi_{-}\|_{r,0,\tau}^{2}) + \nu(\|\partial_{z}\phi_{+}\|_{r,0,\tau}^{2} + \|\partial_{z}\phi_{-}\|_{r,0,\tau}^{2}) = \dot{\tau}(\|A^{r+\frac{1}{2}}e^{\tau A}\phi_{+}\|^{2} + \|A^{r+\frac{1}{2}}e^{\tau A}\phi_{-}\|^{2})
$$

$$
-\left\langle \overline{\phi}\cdot\nabla V_{+} + \overline{\phi}\cdot\nabla\phi_{+} + \overline{V}\cdot\nabla\phi_{+} + \frac{1}{2}(\phi_{+}\cdot\nabla)(\overline{V} + i\overline{V}^{\perp}) + \frac{1}{2}(\phi_{+}\cdot\nabla)(\overline{\phi} + i\overline{\phi}^{\perp})\right\rangle
$$

$$
+\frac{1}{2}(V_{+}\cdot\nabla)(\overline{\phi}+i\overline{\phi}^{+})+e^{i\Omega t}(Q_{1,+,+}-Q_{3,+,+})+e^{-i\Omega t}(Q_{1,-,+}-Q_{3,-,+})+e^{-2i\Omega t}Q_{4,-,+},\phi_{+})\\-\left\langle \overline{\phi}\cdot\nabla V_{-}+\overline{\phi}\cdot\nabla\phi_{-}+\overline{V}\cdot\nabla\phi_{-}+\frac{1}{2}(\phi_{-}\cdot\nabla)(\overline{V}-i\overline{V}^{+})+\frac{1}{2}(\phi_{-}\cdot\nabla)(\overline{\phi}-i\overline{\phi}^{+})\right\rangle\\+\frac{1}{2}(V_{-}\cdot\nabla)(\overline{\phi}-i\overline{\phi}^{+})+e^{-i\Omega t}(Q_{1,-,-}-Q_{3,-,-})+e^{i\Omega t}(Q_{1,+,-}-Q_{3,+,-})+e^{2i\Omega t}Q_{4,+,-},\phi_{-})\\-\frac{1}{2}(A^{r}e^{rA}(\overline{\phi}\cdot\nabla V_{+}),A^{r}e^{rA}\phi_{+})-\frac{1}{2}(A^{r}e^{rA}(\overline{\phi}\cdot\nabla\psi_{-}),A^{r}e^{rA}\phi_{-})\\-\frac{1}{2}(A^{r}e^{rA}(\overline{\phi}\cdot\nabla\phi_{+}),A^{r}e^{rA}\phi_{+})-\frac{1}{2}(A^{r}e^{rA}(\overline{\phi}\cdot\nabla\phi_{-}),A^{r}e^{rA}\phi_{-})\\-\frac{1}{2}(A^{r}e^{rA}(\overline{V}\cdot\nabla\phi_{+}),A^{r}e^{rA}\phi_{+})-\frac{1}{2}(A^{r}e^{rA}(\overline{\phi}\cdot\nabla\phi_{-}),A^{r}e^{rA}\phi_{-})\\-\frac{1}{2}(A^{r}e^{rA}(\phi_{+}\cdot\nabla(\overline{V}+i\overline{V}^{+})),A^{r}e^{rA}\phi_{+})-\frac{1}{2}(A^{r}e^{rA}(\phi_{-}\cdot\nabla(\overline{V}-i\overline{V}^{+})),A^{r}e^{rA}\phi_{-})\\-\frac{1}{2}(A^{r}e^{rA}(\phi_{+}\cdot\nabla(\overline{\phi}+i\overline{\phi}^{+})),A^{r}e^{rA}\phi_{+})-\frac{1}{2}(A^{r}e^{rA}(\phi_{
$$

and

$$
\frac{1}{2} \frac{d}{dt} ||A^r e^{\tau A} \overline{\phi}||^2 = \dot{\tau} ||A^{r+\frac{1}{2}} e^{\tau A} \overline{\phi}||^2
$$
\n
$$
- \underbrace{\left\langle A^r e^{\tau A} (\overline{\phi} \cdot \nabla \overline{V}), A^r e^{\tau A} \overline{\phi} \right\rangle}_{\text{Tp2}} - \underbrace{\left\langle A^r e^{\tau A} (\overline{\phi} \cdot \nabla \overline{\phi}), A^r e^{\tau A} \overline{\phi} \right\rangle}_{\text{Tp1}} - \underbrace{\left\langle A^r e^{\tau A} (\overline{V} \cdot \nabla \overline{\phi}), A^r e^{\tau A} \overline{\phi} \right\rangle}_{\text{Tp4}} - \underbrace{e^{2i\Omega t} \left\langle A^r e^{\tau A} (Q_{1,+,+} + Q_{2,+,+}), A^r e^{\tau A} \overline{\phi} \right\rangle}_{\text{Tp1,Tp2,Tp4,Tp5}} - \underbrace{e^{-2i\Omega t} \left\langle A^r e^{\tau A} (Q_{1,-,-} + Q_{2,-,-}), A^r e^{\tau A} \overline{\phi} \right\rangle}_{\text{Tp1,Tp2,Tp4,Tp5}}, \tag{5.10}
$$

where we have applied Lemmas  $2.2-2.3$  $2.2-2.3$ . It is easy to verify from  $(5.7)$  and  $(5.8)$  that

<span id="page-24-1"></span><span id="page-24-0"></span>
$$
\int_{\mathbb{T}^2} \overline{\phi}(\boldsymbol{x},t) \, d\boldsymbol{x} = \int_{\mathbb{T}^2} \overline{\phi}(\boldsymbol{x},t) |_{t=0} \, d\boldsymbol{x} = 0,
$$

 $\mathop{\boxtimes}$  Birkhäuser

and therefore, applying the Poincaré inequality yields

<span id="page-25-1"></span>
$$
\|\overline{\phi}\| \le \|A^r e^{\tau A} \overline{\phi}\| \qquad \text{and} \qquad \|\overline{\phi}\|_{r,0,\tau} \le C \|A^r e^{\tau A} \overline{\phi}\|.
$$
 (5.11)

In [\(5.9\)](#page-24-0) and [\(5.10\)](#page-24-1), we have labeled five types of terms by  $Tp1, \dots, Tp5$ , which we will present the estimates. The rest lower order terms can be estimated in a similar manner and will be omitted. Temporally, let V denote  $V_{\pm}$  and  $\overline{V}$ , and  $\phi$  denote  $\phi_{\pm}$  and  $\overline{\phi}$ . The aforementioned five types of terms are described in the following:

• Type 1 (labeled as Tp1): terms that are trilinear in  $\phi$ , e.g.,

$$
e^{ji\Omega t} \Big\langle A^r e^{\tau A} ((\phi \cdot \nabla)\phi), A^r e^{\tau A} \phi \Big\rangle, \qquad e^{ji\Omega t} \Big\langle A^r e^{\tau A} ((\nabla \cdot \phi)\phi), A^r e^{\tau A} \phi \Big\rangle,
$$
  
and  

$$
e^{ji\Omega t} \Big\langle A^r e^{\tau A} (\int_0^z (\nabla \cdot \phi(\mathbf{x}, s)) ds \partial_z \phi), A^r e^{\tau A} \phi \Big\rangle, \qquad j = 0, \pm 1, \pm 2;
$$

• Type 2 (labeled as Tp2): terms that are bilinear in  $\phi$  with no derivative of  $\phi$ , e.g.,

$$
e^{ji\Omega t} \left\langle A^r e^{\tau A} \left( (\phi \cdot \nabla) V \right), A^r e^{\tau A} \phi \right\rangle \quad \text{and}
$$

$$
e^{ji\Omega t} \left\langle A^r e^{\tau A} \left( (\nabla \cdot V) \phi \right), A^r e^{\tau A} \phi \right\rangle, \qquad j = 0, \pm 1, \pm 2;
$$

• Type 3 (labeled as Tp3): terms that are bilinear in  $\phi$  and a vertical derivative of  $\phi$ , e.g.,

$$
e^{ji\Omega t} \Big \langle A^r e^{\tau A} \big (\int_0^z (\nabla \cdot V(\boldsymbol{x}, s)) \, ds \partial_z \phi \big ), A^r e^{\tau A} \phi \Big \rangle, \qquad j = 0, \pm 1, \pm 2;
$$

• Type 4 (labeled as Tp4): terms that are bilinear in  $\phi$  and a horizontal derivative of  $\phi$ , e.g.,

$$
e^{ji\Omega t} \Big\langle A^r e^{\tau A} ((V \cdot \nabla) \phi), A^r e^{\tau A} \phi \Big\rangle, \qquad e^{ji\Omega t} \Big\langle A^r e^{\tau A} ((\nabla \cdot \phi) V), A^r e^{\tau A} \phi \Big\rangle,
$$
  
and  

$$
e^{ji\Omega t} \Big\langle A^r e^{\tau A} \Big( \int_0^z (\nabla \cdot \phi(\mathbf{x}, s)) ds \partial_z V \Big), A^r e^{\tau A} \phi \Big\rangle, \qquad j = 0, \pm 1, \pm 2;
$$

• Type 5 (labeled as Tp5): terms that are linear in  $\phi$ , e.g.,

$$
e^{ji\Omega t} \Big\langle A^r e^{\tau A} ((V \cdot \nabla) V), A^r e^{\tau A} \phi \Big\rangle, \qquad e^{ji\Omega t} \Big\langle A^r e^{\tau A} ((\nabla \cdot V) V), A^r e^{\tau A} \phi \Big\rangle,
$$
  
and 
$$
e^{ji\Omega t} \Big\langle A^r e^{\tau A} \Big( \int_0^z (\nabla \cdot V(\boldsymbol{x}, s)) \, ds \partial_z V \Big), A^r e^{\tau A} \phi \Big\rangle, \qquad j = \pm 1, \pm 2.
$$

<span id="page-25-0"></span>**5.2.1. Estimates of Type 1 – Type 4 Terms.** We start with Type 1 terms. Applying Lemmas [A.1](#page-35-0)[–A.3](#page-39-1) yields

$$
|\mathrm{Tp1}| \leq C_r \int_0^1 \underbrace{\|A^{r+\frac{1}{2}} e^{\tau A} \phi(z)\|_{L^2(\mathbb{T}^2)}^2}_{L^1 \text{ in } z} \underbrace{\left(\|A^r e^{\tau A} \phi(z)\|_{L^2(\mathbb{T}^2)} + \|\phi(z)\|_{L^2(\mathbb{T}^2)}\right)}_{L^\infty \text{ in } z} dz
$$
  
+ 
$$
C_r \|A^{r+\frac{1}{2}} e^{\tau A} \phi\|^2 \|\partial_z \phi\|_{r,0,\tau} \leq C_r \|A^{r+\frac{1}{2}} e^{\tau A} \phi\|^2 \|\phi\|_{r,1,\tau},
$$

where we have used the embedding  $L_z^{\infty} \hookrightarrow H_z^1$  in the z-variable and the Hölder inequality. Notice that, for  $\phi = \overline{\phi}$ , the estimate is similar with obvious modification. Therefore, hereafter, unless pointed out explicitly, we omit the estimates in the case of  $\phi = \overline{\phi}$  and, similarly,  $V = \overline{V}$ .

Similarly, applying Lemma [2.1](#page-5-0) to Types 2 and 3 terms yields

$$
|\text{Tp2}| \leq C_r \int_0^1 \underbrace{(\|A^{r+1}e^{\tau A}V(z)\|_{L^2(\mathbb{T}^2)} + \|V(z))\|_{L^2(\mathbb{T}^2)})}_{L^\infty \text{ in } z} \underbrace{(\|A^r e^{\tau A}\phi(z)\|_{L^2(\mathbb{T}^2)} + \|\phi(z))\|_{L^2(\mathbb{T}^2)})^2}_{L^1 \text{ in } z} dz
$$
  

$$
\leq C_r \|V\|_{r+1,1,\tau} \|\phi\|_{r,0,\tau}^2 \qquad \text{and}
$$

$$
|\text{Tp3}| \leq C_r \int_0^1 \left[ \underbrace{\left( \int_0^z \|A^{r+1} e^{\tau A} V(s) \|_{L^2(\mathbb{T}^2)} + \|V(s)\|_{L^2(\mathbb{T}^2)} ds \right)}_{L^\infty \text{ in } z} \underbrace{\left( \|A^r e^{\tau A} \partial_z \phi(z) \|_{L^2(\mathbb{T}^2)} + \|\partial_z \phi(z) \|_{L^2(\mathbb{T}^2)} \right)}_{L^2 \text{ in } z}
$$
\n
$$
\times \underbrace{\left( \|A^r e^{\tau A} \phi(z) \|_{L^2(\mathbb{T}^2)} + \|\phi(z) \|_{L^2(\mathbb{T}^2)} \right)}_{L^2 \text{ in } z}
$$
\n
$$
\leq \frac{\nu}{2} \|\partial_z \phi\|_{r,0,\tau}^2 + \frac{C_r}{\nu} \|V\|_{r+1,0,\tau}^2 \|\phi\|_{r,0,\tau}^2.
$$

In order to estimate Type 4 terms, notice that Tp4 can be written as, with abuse of notations,

$$
\mathrm{Tp}4=\mathrm{Tp}4_1+\mathrm{Tp}4_2,
$$

where

$$
Tp4_1 := e^{ji\Omega t} \Big\langle (V \cdot \nabla) A^r e^{\tau A} \phi, A^r e^{\tau A} \phi \Big\rangle + e^{ji\Omega t} \Big\langle (\nabla \cdot A^r e^{\tau A} \phi) V, A^r e^{\tau A} \phi \Big\rangle
$$
  
+ 
$$
e^{ji\Omega t} \Big\langle \int_0^z (\nabla \cdot A^r e^{\tau A} \phi(s)) ds \partial_z V, A^r e^{\tau A} \phi \Big\rangle,
$$
  

$$
Tp4_2 := e^{ji\Omega t} \Big\langle A^r e^{\tau A} ((V \cdot \nabla) \phi) - (V \cdot \nabla) A^r e^{\tau A} \phi, A^r e^{\tau A} \phi \Big\rangle
$$
  
+ 
$$
e^{ji\Omega t} \Big\langle A^r e^{\tau A} ((\nabla \cdot \phi) V) - (\nabla \cdot A^r e^{\tau A} \phi) V, A^r e^{\tau A} \phi \Big\rangle
$$
  
+ 
$$
e^{ji\Omega t} \Big\langle A^r e^{\tau A} (\int_0^z (\nabla \cdot \phi(s)) ds \partial_z V) - \int_0^z (\nabla \cdot A^r e^{\tau A} \phi(s)) ds \partial_z V, A^r e^{\tau A} \phi \Big\rangle.
$$

Observing from [\(5.9\)](#page-24-0) and [\(5.10\)](#page-24-1), only for  $V = V_{\pm}$ , Tp4<sub>1</sub> is nontrivial. Therefore, after substituting the inequality  $|\alpha|^{\frac{1}{2}} \leq |\beta|^{\frac{1}{2}} + |\xi|^{\frac{1}{2}}$  for  $\alpha + \beta = \xi$  in the Fourier representation of Tp4<sub>1</sub> (see the proof of Lemma [A.2](#page-37-0) in the appendix), one can obtain that, for any  $\delta \in (0,1)$ ,

$$
|\text{Tp4}_1| \leq \left| \left\langle (A^{\frac{1}{2}}V_{\pm} \cdot \nabla) A^{r-\frac{1}{2}} e^{rA} \phi, A^r e^{rA} \phi \right\rangle \right| + \left| \left\langle (V_{\pm} \cdot \nabla) A^{r-\frac{1}{2}} e^{rA} \phi, A^{r+\frac{1}{2}} e^{rA} \phi \right\rangle \right|
$$
  
+  $\left| \left\langle (\nabla \cdot A^{r-\frac{1}{2}} e^{rA} \phi) A^{\frac{1}{2}} V_{\pm}, A^r e^{rA} \phi \right\rangle \right| + \left| \left\langle (\nabla \cdot A^{r-\frac{1}{2}} e^{rA} \phi) V_{\pm}, A^{r+\frac{1}{2}} e^{rA} \phi \right\rangle \right|$   
+  $\left| \left\langle \int_0^z (\nabla \cdot A^{r-\frac{1}{2}} e^{rA} \phi(s)) ds \partial_z A^{\frac{1}{2}} V_{\pm}, A^r e^{rA} \phi \right\rangle \right| + \left| \left\langle \int_0^z (\nabla \cdot A^{r-\frac{1}{2}} e^{rA} \phi(s)) ds \partial_z V_{\pm}, A^{r+\frac{1}{2}} e^{rA} \phi \right\rangle \right|$   

$$
\leq C_r \int_0^1 \underbrace{\left( \| A^{\frac{1}{2}} V_{\pm}(z) \|_{H^{1+\delta}(\mathbb{T}^2)} + \| V_{\pm}(z) \|_{H^{1+\delta}(\mathbb{T}^2)} \right)}_{L^{\infty} \text{ in } z} \underbrace{\left| A^{r+\frac{1}{2}} e^{rA} \phi(z) \right\|_{L^2(\mathbb{T}^2)}_{L^1 \text{ in } z}} dz
$$
  
+ 
$$
C_r \int_0^1 \underbrace{\left[ \int_0^z \| A^{r+\frac{1}{2}} e^{rA} \phi(s) \|_{L^2(\mathbb{T}^2)} ds \times \underbrace{\left| A^{r+\frac{1}{2}} e^{rA} \phi(z) \|_{L^2(\mathbb{T}^2)}_{L^2 \text{ in } z} \right|}_{L^2 \text{ in } z} dz} \times \underbrace{\left( \| \partial_z A^{\frac{1}{2}} V_{\pm}(z) \|_{H^{1+\delta}(\mathbb{T}^2)} + \| \partial_z V_{\pm
$$

where we have applied the Sobolev embedding inequality and the Hölder inequality. Meanwhile, applying Lemmas  $A.4-A.6$  $A.4-A.6$  to  $Tp4<sub>2</sub>$  yields

$$
|\text{Tp4}_2| \leq C_r \int_0^1 \|A^r \phi(z)\|_{L^2(\mathbb{T}^2)}^2 \|A^r V(z)\|_{L^2(\mathbb{T}^2)} dz
$$
  
+  $C_r \tau \int_0^1 \|A^{r+\frac{1}{2}} e^{\tau A} \phi(z)\|_{L^2(\mathbb{T}^2)}^2 \|A^{r+\frac{1}{2}} e^{\tau A} V(z)\|_{L^2(\mathbb{T}^2)} dz$   
+  $C_r \|A^r \partial_z V\| \|A^r \phi\|^2 + C_r \tau \|A^{r+\frac{1}{2}} e^{\tau A} \partial_z V\| \|A^{r+\frac{1}{2}} e^{\tau A} \phi\|^2$ 

$$
\leq C_r \|V\|_{r,1,\tau} \|\phi\|_{r,0,\tau}^2 + C_r \tau \|V\|_{r+\frac{1}{2},1,\tau} \|A^{r+\frac{1}{2}} e^{\tau A} \phi\|^2.
$$

*Remark 12.* For the interested readers, we refer to [\[23\]](#page-42-9) for an alternative estimate of  $Tp4<sub>1</sub>$ , where some cancellations are taking care of. However, in this paper, such cancellations are not necessary and thus omitted. Notably, the terms  $||V_{\pm}||_{\frac{3}{2}+\delta,1,0}$  in the estimate of  $Tp4_1$  is the reason for the requirement [\(5.2\)](#page-22-4).

<span id="page-27-3"></span>**5.2.2.** Estimates of Type 5 Terms. In this case,  $j \neq 0$  and  $e^{j\Omega it} = \frac{1}{j\Omega i}$  $\frac{d}{dt}e^{j\Omega it}$ . Therefore, Tp5 can be written as, with abuse of notations,

$$
\mathrm{Tp5} = \frac{1}{\Omega} \partial_t N + \frac{1}{\Omega} R,
$$

with

$$
N := \frac{e^{j\Omega it}}{j i} \left[ \left\langle A^r e^{\tau A} ((V \cdot \nabla) V), A^r e^{\tau A} \phi \right\rangle + \left\langle A^r e^{\tau A} ((\nabla \cdot V) V), A^r e^{\tau A} \phi \right\rangle \right. \\
\left. + \left\langle A^r e^{\tau A} \left( \int_0^z (\nabla \cdot V(s)) \, ds \partial_z V \right), A^r e^{\tau A} \phi \right\rangle \right],
$$
\n
$$
R := \frac{e^{j\Omega it}}{j i} \left[ \partial_t \left\langle A^r e^{\tau A} ((V \cdot \nabla) V), A^r e^{\tau A} \phi \right\rangle + \partial_t \left\langle A^r e^{\tau A} ((\nabla \cdot V) V), A^r e^{\tau A} \phi \right\rangle \right]
$$
\n(5.12)

$$
+ \underbrace{\partial_t \left\langle A^r e^{\tau A} \left( \int_0^z (\nabla \cdot V(s)) \, ds \partial_z V \right), A^r e^{\tau A} \phi \right\rangle}_{=:R_3} \right]. \tag{5.13}
$$

It is straightforward to check that

<span id="page-27-4"></span>
$$
N \leq C_r \|V\|_{r,1,\tau} \|V\|_{r+1,0,\tau} \|\phi\|_{r,0,\tau}.
$$
\n(5.14)

Meanwhile, one has

$$
R_1 = 2\dot{\tau} \left\langle A^{r+1} e^{\tau A} \left( (V \cdot \nabla) V \right), A^r e^{\tau A} \phi \right\rangle + \left\langle A^r e^{\tau A} \partial_t \left( (V \cdot \nabla) V \right), A^r e^{\tau A} \phi \right\rangle + \left\langle A^r e^{\tau A} \left( (V \cdot \nabla) V \right), A^r e^{\tau A} \partial_t \phi \right\rangle =: R_{1,1} + R_{1,2} + R_{1,3}.
$$

It follows that, thanks to Lemma [2.1](#page-5-0) and similar arguments as in section [5.2.1,](#page-25-0)

<span id="page-27-0"></span>
$$
R_{1,1} \le C_r |\dot{\tau}| \|V\|_{r+1,1,\tau} \|V\|_{r+2,0,\tau} \|\phi\|_{r,0,\tau}.
$$
\n(5.15)

After applying the Leray projection [\(2.12\)](#page-6-5) to [\(4.4\)](#page-18-0), together with [\(4.2\)](#page-18-1) and [\(4.3\)](#page-18-2), for  $V = V_{\pm}$  or  $\overline{V}$ , one has

<span id="page-27-2"></span>
$$
\partial_t V - \underbrace{\nu \partial_{zz} V}_{\text{for } V = V_{\pm}} = \mathcal{B}(V, \nabla V). \tag{5.16}
$$

Here we use  $\beta$  to represent a generic bilinear term with respect to both of its arguments. With such notations, after applying integration by parts, one can derive

<span id="page-27-1"></span>
$$
R_{1,2} = -2\nu \left\langle A^r e^{\tau A} \left( (\partial_z V \cdot \nabla) \partial_z V \right), A^r e^{\tau A} \phi \right\rangle - \nu \left\langle A^r e^{\tau A} \left( (\partial_z V \cdot \nabla) V + (V \cdot \nabla) \partial_z V \right), A^r e^{\tau A} \partial_z \phi \right\rangle
$$
  
+ 
$$
\left\langle A^r e^{\tau A} \left( (\mathcal{B}(V, \nabla V) \cdot \nabla) V + (V \cdot \nabla) \mathcal{B}(V, \nabla V) \right), A^r e^{\tau A} \phi \right\rangle
$$
  

$$
\leq C_r (1+\nu) \left( ||V||_{r,1,\tau} ||V||_{r+1,1,\tau} ||\phi||_{r,1,\tau} + ||V||_{r,0,\tau} ||V||_{r+1,1,\tau}^2 ||\phi||_{r,0,\tau} + ||V||_{r+1,1,\tau}^2 ||V||_{r+2,0,\tau} ||\phi||_{r,0,\tau} \right),
$$
  
(5.17)

where we have applied Lemma [2.1](#page-5-0) and similar arguments as in section [5.2.1.](#page-25-0) Similarly, according to [\(5.6\)](#page-23-2)–[\(5.7\)](#page-23-3), for  $\phi = \phi_{\pm}$  or  $\overline{\phi}$ , one has, with abuse of notations

<span id="page-28-1"></span>
$$
\partial_t \phi - \underbrace{(\nu \partial_{zz} \phi + e^{j\Omega it} (\int_0^z \nabla \cdot (\phi + V)(s) ds) \partial_z (\phi + V))}_{\text{for } \phi = \phi_{\pm} \text{ and } V = V_{\pm}} = \sum_{A, B \in \{\phi, V\}} \mathcal{B}(A, \nabla B). \tag{5.18}
$$

Therefore,  $R_{1,3}$  can be estimated as

<span id="page-28-0"></span>
$$
R_{1,3} = -\nu \Big\langle A^r e^{\tau A} \big( (\partial_z V \cdot \nabla) V + (V \cdot \nabla) \partial_z V \big), A^r e^{\tau A} \partial_z \phi \Big\rangle
$$
  
\n
$$
-e^{j\Omega it} \Big\langle A^{r+1} e^{\tau A} \big( (V \cdot \nabla) V \big), A^{r-1} e^{\tau A} \big( \big( \int_0^z \nabla \cdot (\phi + V)(s) \, ds \big) \partial_z (\phi + V) \big) \Big\rangle
$$
  
\n
$$
- \sum_{A,B \in \{\phi, V\}} \Big\langle A^{r+1} e^{\tau A} \big( (V \cdot \nabla) V \big), A^{r-1} e^{\tau A} \mathcal{B}(A, \nabla B) \Big\rangle
$$
  
\n
$$
\leq C_r \nu ||V||_{r,1,\tau} ||V||_{r+1,1,\tau} ||\partial_z \phi||_{r,0,\tau}
$$
  
\n
$$
+ C_r ||V||_{r+1,1,\tau} ||V||_{r+2,0,\tau} (||\phi||_{r-1,1,\tau} + ||V||_{r-1,1,\tau}) (||\phi||_{r,0,\tau} + ||V||_{r,0,\tau}).
$$
  
\n(5.19)

The estimate of  $R_2$  is the same as  $R_1$  (see [\(5.15\)](#page-27-0), [\(5.17\)](#page-27-1), and [\(5.19\)](#page-28-0)). To estimate  $R_3$ , one has, after applying integration by parts,

$$
R_3 = 2\dot{\tau} \left\langle A^{r+1} e^{\tau A} \left( \int_0^z (\nabla \cdot V(s)) \, ds \partial_z V \right), A^r e^{\tau A} \phi \right\rangle - \left\langle A^r e^{\tau A} \partial_t ((\nabla \cdot V)V), A^r e^{\tau A} \phi \right\rangle
$$
  
 
$$
- \left\langle A^r e^{\tau A} \partial_t \left( \int_0^z (\nabla \cdot V(s)) \, ds V \right), A^r e^{\tau A} \partial_z \phi \right\rangle + \left\langle A^r e^{\tau A} \left( \int_0^z (\nabla \cdot V(s)) \, ds \partial_z V \right), A^r e^{\tau A} \partial_t \phi \right\rangle
$$
  
=:  $R_{3,1} + R_{3,2} + R_{3,3} + R_{3,4}.$ 

As before,

$$
R_{3,1} \le C_r |\dot{\tau}| \|V\|_{r+2,0,\tau} \|V\|_{r+1,1,\tau} \|\phi\|_{r,0,\tau}.
$$
\n(5.20)

The estimate of  $R_{3,2}$  is the same as that of  $R_{1,2}$  in [\(5.17\)](#page-27-1). Meanwhile, substituting representation [\(5.16\)](#page-27-2) in  $R_{3,3}$  leads to

$$
R_{3,3} = -\left\langle A^r e^{\tau A} \left( \int_0^z (\nabla \cdot \partial_t V(s)) ds V \right), A^r e^{\tau A} \partial_z \phi \right\rangle - \left\langle A^r e^{\tau A} \left( \int_0^z (\nabla \cdot V(s)) ds \partial_t V \right), A^r e^{\tau A} \partial_z \phi \right\rangle
$$
  
\n
$$
= -\left\langle A^r e^{\tau A} \left( \int_0^z (\nabla \cdot (\nu \partial_{zz} V + \mathcal{B}(V, \nabla V))(s)) ds V \right), A^r e^{\tau A} \partial_z \phi \right\rangle
$$
  
\n
$$
- \left\langle A^r e^{\tau A} \left( \int_0^z (\nabla \cdot V(s)) ds (\nu \partial_{zz} V + \mathcal{B}(V, \nabla V))), A^r e^{\tau A} \partial_z \phi \right\rangle
$$
  
\n
$$
\leq C_r (\nu \|V\|_{r+1,0,\tau} \|V\|_{r,2,\tau} + \|V\|_{r+1,0,\tau} \|V\|_{r,1,\tau} \|V\|_{r+2,0,\tau}) \|\partial_z \phi\|_{r,0,\tau}.
$$
\n(5.21)

After substituting  $(5.18)$ ,  $R_{3,4}$  can be estimated as

<span id="page-28-2"></span>
$$
R_{3,4} = -\nu \Big\langle A^{r} e^{\tau A} \Big( \int_{0}^{z} (\nabla \cdot V(s)) \, ds \partial_{zz} V \Big), A^{r} e^{\tau A} \partial_{z} \phi \Big\rangle - \nu \Big\langle A^{r} e^{\tau A} \Big( (\nabla \cdot V) \partial_{z} V \Big), A^{r} e^{\tau A} \partial_{z} \phi \Big\rangle - e^{i\Omega it} \Big\langle A^{r+1} e^{\tau A} \Big( \int_{0}^{z} (\nabla \cdot V(s)) \, ds \partial_{z} V \Big), A^{r-1} e^{\tau A} \Big[ \Big( \int_{0}^{z} \nabla \cdot (\phi + V)(s) \, ds \Big) \partial_{z} (\phi + V) \Big] \Big\rangle - \sum_{A,B \in \{\phi, V\}} \Big\langle A^{r+1} e^{\tau A} \Big( \int_{0}^{z} (\nabla \cdot V(s)) \, ds \partial_{z} V \Big), A^{r-1} e^{\tau A} \mathcal{B}(A, \nabla B) \Big\rangle \leq C_{r} \nu \|V\|_{r+1,0,\tau} \|V\|_{r,2,\tau} \|\partial_{z} \phi\|_{r,0,\tau} + C_{r} \|V\|_{r+2,0,\tau} \|V\|_{r+1,1,\tau} (\|\phi\|_{r,0,\tau} + \|V\|_{r,0,\tau}) (\|\phi\|_{r-1,1,\tau} + \|V\|_{r-1,1,\tau}).
$$
\n
$$
(5.22)
$$

We emphasize that, in the estimates above, we do not distinguish  $V_{\pm}$  and  $\overline{V}$ ,  $\phi_{\pm}$  and  $\overline{\phi}$ , i.e., we treat all V and  $\phi$  as if they are three-dimensional. The estimates in the case when they are two-dimensional are similar with obvious modifications, and thus omitted. Consequently, combining [\(5.15\)](#page-27-0)–[\(5.22\)](#page-28-2) leads to the estimate of R.

**5.2.3. Finishing of Proof of Theorem [5.1.](#page-21-0)** Without loss of generality, we assume  $|\Omega| > 1$ . Combining the estimates in subsections [5.2.1](#page-25-0) and [5.2.2,](#page-27-3) from  $(5.9)$  and  $(5.10)$ , yields, thanks to  $(5.11)$  and the Young inequality,

<span id="page-29-0"></span>
$$
\frac{d}{dt}F + \nu H \le \left[\dot{\tau} + C_r K^{\frac{1}{2}} \tau + C_r \left(\|V_+\|_{\frac{3}{2} + \delta, 1, 0} + \|V_-\|_{\frac{3}{2} + \delta, 1, 0}\right) \right.\n+ C_r F^{\frac{1}{2}} + C_r H^{\frac{1}{2}}\right] \times G + C_r (1 + \nu + \frac{1}{\nu}) \left(K^2 + 1\right) F \n+ \frac{C_r (1 + \nu)}{|\Omega|} K H + \frac{C_r}{|\Omega|} \left(\nu \|\partial_z V_+\|_{r, 1, \tau} + \nu \|\partial_z V_-\|_{r, 1, \tau}\right) K^{\frac{1}{2}} H^{\frac{1}{2}} \n+ \frac{C_r (1 + \nu)}{|\Omega|} \left(|\dot{\tau}|^2 + K^2 + 1\right) + \frac{1}{|\Omega|} \partial_t N.
$$
\n(5.23)

where  $\delta \in (0, \frac{1}{2})$  and

$$
F := \|A^r e^{\tau A} \overline{\phi}\|^2 + \|\phi_+\|^2_{r,0,\tau} + \|\phi_-\|^2_{r,0,\tau},\tag{5.24}
$$

$$
G := \|A^{r+\frac{1}{2}}e^{\tau A}\overline{\phi}\|^2 + \|A^{r+\frac{1}{2}}e^{\tau A}\phi_+\|^2 + \|A^{r+\frac{1}{2}}e^{\tau A}\phi_-\|^2,\tag{5.25}
$$

$$
H := \|\partial_z \phi_+\|_{r,0,\tau}^2 + \|\partial_z \phi_-\|_{r,0,\tau}^2,\tag{5.26}
$$

$$
K := \|\overline{V}\|_{r+2,0,\tau}^2 + \|V_+\|_{r+2,0,\tau}^2 + \|V_-\|_{r+2,0,\tau}^2 + \|V_+\|_{r+1,1,\tau}^2 + \|V_-\|_{r+1,1,\tau}^2. \tag{5.27}
$$

Assume that, for the moment, we have

<span id="page-29-3"></span>
$$
\dot{\tau} + C_r K^{\frac{1}{2}} \tau + C_r \left( \|V_+ \|_{\frac{3}{2} + \delta, 1, 0} + \|V_- \|_{\frac{3}{2} + \delta, 1, 0} \right) + C_r F^{\frac{1}{2}} + C_r H^{\frac{1}{2}} = 0,
$$
\n(5.28)

which implies  $\tau \leq \tau_0$  and

<span id="page-29-7"></span><span id="page-29-6"></span><span id="page-29-5"></span><span id="page-29-4"></span><span id="page-29-2"></span>
$$
|\dot{\tau}|^2 \le C_r(\tau_0^2 + 1)K + C_r(F + H).
$$

On the other hand, recalling M as in  $(5.1)$ , then according to Proposition [4.2,](#page-19-4)  $(4.8)$ , and  $(4.9)$ , there exist  $C_M, C_r > 1$  such that

$$
K + \int_0^t \left( \nu \| \partial_z V_+(s) \|_{r,1,\tau}^2 + \nu \| \partial_z V_-(s) \|_{r,1,\tau}^2 \right) ds \le \exp[\exp[\exp(C_r t + C_M)]] =: \mathcal{K}(t),
$$
 (5.29)  
and

$$
\int_0^t \left( \|V_+(s)\|_{\frac{3}{2}+\delta,1,0}^2 + \|V_-(s)\|_{\frac{3}{2}+\delta,1,0}^2 \right) ds \le (1+\frac{1}{\nu}) \|\widetilde{V}_0\|_{\frac{3}{2}+\delta,0,0}^2 \mathcal{K}(t). \tag{5.30}
$$

Under these conditions, from [\(5.23\)](#page-29-0), one can derive that

<span id="page-29-1"></span>
$$
\frac{d}{dt}F + \frac{\nu}{2}H \le C_r(1+\nu+\frac{1}{\nu})\left(\mathcal{K}^2+1\right)F + \frac{C_r(1+\nu)}{|\Omega|}(\mathcal{K}+1)H + \frac{C_r}{|\Omega|^2}\left(\nu\|\partial_z V_+\|_{r,1,\tau}^2 + \nu\|\partial_z V_-\|_{r,1,\tau}^2\right)\mathcal{K}
$$
\n
$$
+ \frac{C_r(1+\nu)}{|\Omega|}\left(\mathcal{K}^2+\tau_0^4+1\right) + \frac{1}{|\Omega|}\partial_t N. \tag{5.31}
$$

Therefore, multiplying [\(5.31\)](#page-29-1) with  $e^{-C_r(1+\nu+\frac{1}{\nu})\int_0^t (\mathcal{K}^2+1)(s) ds}$  leads to

$$
\frac{d}{dt} \left( F e^{-C_r (1+\nu+\frac{1}{\nu}) \int_0^t (\mathcal{K}^2+1)(s) ds} \right) + \left[ \frac{\nu}{2} - \frac{C_r (1+\nu)}{|\Omega|} (\mathcal{K}+1) \right] H e^{-C_r (1+\nu+\frac{1}{\nu}) \int_0^t (\mathcal{K}^2+1)(s) ds}
$$
\n
$$
\leq \frac{C_r}{|\Omega|^2} \left( \nu \| \partial_z V_+ \|_{r,1,\tau}^2 + \nu \| \partial_z V_- \|_{r,1,\tau}^2 \right) \mathcal{K} e^{-C_r (1+\nu+\frac{1}{\nu}) \int_0^t (\mathcal{K}^2+1)(s) ds}
$$

$$
+\, \frac{C_r(1+\nu)}{|\Omega|}\Big(\mathcal{K}^2+\tau_0^4+1\Big)e^{-C_r(1+\nu+\frac{1}{\nu})\int_0^t(\mathcal{K}^2+1)(s)\,ds}+\frac{1}{|\Omega|}\partial_t N\times e^{-C_r(1+\nu+\frac{1}{\nu})\int_0^t(\mathcal{K}^2+1)(s)\,ds}.
$$

Integrating the above equation in time and recalling that  $F(t = 0) = 0$ , one obtains

<span id="page-30-0"></span>
$$
(F(t)e^{-C_r(1+\nu+\frac{1}{\nu})\int_0^t (\mathcal{K}^2+1)(s) ds}) + \int_0^t \left[\frac{\nu}{2} - \frac{C_r(1+\nu)}{|\Omega|}(\mathcal{K}(t') + 1)\right] H(t')e^{-C_r(1+\nu+\frac{1}{\nu})\int_0^t (\mathcal{K}^2+1)(s) ds} dt'
$$
  
\n
$$
\leq \int_0^t \frac{C_r}{|\Omega|^2} \left(\nu ||\partial_z V_+(t')||_{r,1,\tau}^2 + \nu ||\partial_z V_-(t')||_{r,1,\tau}^2\right) \mathcal{K}e^{-C_r(1+\nu+\frac{1}{\nu})\int_0^t (\mathcal{K}^2+1)(s) ds} dt'
$$
  
\n
$$
+ \int_0^t \frac{C_r(1+\nu)}{|\Omega|} \left(\mathcal{K}^2(t') + \tau_0^4 + 1\right) e^{-C_r(1+\nu+\frac{1}{\nu})\int_0^t (\mathcal{K}^2+1)(s) ds} dt'
$$
  
\n
$$
+ \int_0^t \frac{1}{|\Omega|} \partial_t N(t') e^{-C_r(1+\nu+\frac{1}{\nu})\int_0^t (\mathcal{K}^2+1)(s) ds} dt'
$$
  
\n
$$
\leq \frac{C_r}{|\Omega|^2} \mathcal{K}(t) + \frac{C_r(1+\nu)}{|\Omega|} \int_0^t (\mathcal{K}(t') + \tau_0^4 + 1) dt' + \frac{1}{|\Omega|} \int_0^t \partial_t N(t') e^{-C_r(1+\nu+\frac{1}{\nu})\int_0^t (\mathcal{K}^2+1)(s) ds} dt',
$$
\n(5.32)

where we have applied  $(5.29)$  and, thanks to the definition of  $K$ ,

<span id="page-30-2"></span>
$$
\mathcal{K}(t')e^{-C_r(1+\nu+\frac{1}{\nu})\int_0^{t'} (\mathcal{K}^2+1)(s)ds} < C,\tag{5.33}
$$

for some constant  $C \in (0,\infty)$ . On the other hand, thanks to [\(5.14\)](#page-27-4), [\(5.29\)](#page-29-2), and [\(5.33\)](#page-30-2), since  $N(t=0) = 0$ , one can derive that

<span id="page-30-5"></span>
$$
\int_{0}^{t} \partial_{t}N(t')e^{-C_{r}(1+\nu+\frac{1}{\nu})\int_{0}^{t'}(K^{2}+1)(s)\,ds}\,dt' = N(t)e^{-C_{r}(1+\nu+\frac{1}{\nu})\int_{0}^{t}(K^{2}+1)(s)\,ds}
$$
\n
$$
+ C_{r}(1+\nu+\frac{1}{\nu})\int_{0}^{t} N(t')(K^{2}(t')+1)e^{-C_{r}(1+\nu+\frac{1}{\nu})\int_{0}^{t'}(K^{2}+1)(s)\,ds}\,dt'
$$
\n
$$
\leq K(t)e^{-C_{r}(1+\nu+\frac{1}{\nu})\int_{0}^{t}(K^{2}+1)(s)\,ds}F^{\frac{1}{2}}(t)+C_{r}\left(1+\nu+\frac{1}{\nu}\right)
$$
\n
$$
\int_{0}^{t}(K^{2}(t')+1)K(t')F^{\frac{1}{2}}(t')e^{-C_{r}(1+\nu+\frac{1}{\nu})\int_{0}^{t'}(K^{2}+1)(s)\,ds}\,dt'
$$
\n
$$
\leq C_{r}F^{\frac{1}{2}}(t)+C_{r}(1+\nu+\frac{1}{\nu})\int_{0}^{t}(K^{2}(t')+1)F^{\frac{1}{2}}(t')\,dt'.
$$
\n(5.34)

Hence, [\(5.32\)](#page-30-0) implies that, for  $t \in [0, T]$ , since  $|\Omega| > 1$ , after applying the young inequality,

<span id="page-30-4"></span>
$$
F(t) + \frac{\nu}{4} \int_0^t H(t') dt' \leq \frac{C_r}{|\Omega|} \mathcal{K}(t) e^{C_r (1 + \nu + \frac{1}{\nu}) \int_0^t (\mathcal{K}^2 + 1)(s) ds} + \frac{C_r (1 + \nu + \frac{1}{\nu})^2}{|\Omega|} \left( \int_0^t (\mathcal{K}^2(t') + 1) dt' \right)^2 e^{C_r (1 + \nu + \frac{1}{\nu}) \int_0^t (\mathcal{K}^2 + 1)(s) ds} + \frac{C_r (1 + \nu)}{|\Omega|} \int_0^t (\mathcal{K}(t') + \tau_0^4 + 1) dt' \times e^{C_r (1 + \nu + \frac{1}{\nu}) \int_0^t (\mathcal{K}^2 + 1)(s) ds},
$$
\n(5.35)

where  $\mathcal{T} \in (0,\infty]$  is given by the following constraints:

<span id="page-30-1"></span>
$$
\tau(s) > 0
$$
 and  $\frac{\nu}{2} - \frac{C_r(1+\nu)}{|\Omega|}(\mathcal{K}(s) + 1) \ge \frac{\nu}{4} > 0$  for  $s \in [0, T].$  (5.36)

Since  $|\Omega| \geq |\Omega_0|$ , in particular, there exists a constant  $\mathcal{C}_{M,r,\tau_0} \in (1,\infty)$  such that, for  $t \in (0,\mathcal{T}],$ 

<span id="page-30-3"></span>
$$
F(t) + \frac{\nu}{4} \int_0^t H(t') dt' \le \frac{1}{|\Omega_0|} (1 + \nu + \frac{1}{\nu})^2 \exp\left[ (1 + \nu + \frac{1}{\nu}) \exp\left[ \exp\left[ \exp\left[ C_{M,\tau,\tau_0}(t+1) \right] \right] \right] \right].
$$
 (5.37)

Now we will be able to estimate T. To ensure  $\tau > 0$  in [\(5.36\)](#page-30-1), from [\(5.28\)](#page-29-3), [\(5.29\)](#page-29-2), [\(5.30\)](#page-29-4), and [\(5.37\)](#page-30-3), one has

<span id="page-31-0"></span>
$$
\tau(t) = -C_r \int_0^t e^{-C_r \int_{t'}^t K^{\frac{1}{2}}(s) ds} (\|V_+\|_{3/2+\delta,1,0} + \|V_-\|_{3/2+\delta,1,0} + F^{\frac{1}{2}} + H^{\frac{1}{2}}) dt'
$$
  
+ 
$$
\tau_0 e^{-C_r \int_0^t K^{\frac{1}{2}}(t') dt'} \ge \tau_0 \exp[\exp[\exp[-C'_{M,r}(t+1)]]]]
$$
  
- 
$$
C_r \left( (1 + \frac{1}{\nu^{1/2}}) \|\widetilde{V}_0\|_{\frac{3}{2}+\delta,0,0} + \frac{1}{|\Omega_0|^{1/2}} (1 + \nu + \frac{1}{\nu^{3/2}}) \right)
$$
  

$$
\exp\left[ (1 + \nu + \frac{1}{\nu}) \exp[\exp[c_{M,r,\tau_0}(t+1)]]] \right]
$$
(5.38)

for some constant  $\mathcal{C}_{M,r}, \mathcal{C}_{M,r,\tau_0} \in (1,\infty)$ . Notably, the function  $\tau(t)$  we obtain is bounded above by  $(4.15)$ . Therefore, for  $t > 0$  satisfying

<span id="page-31-2"></span>
$$
\exp\left[(1+\nu+\frac{1}{\nu})\exp[\exp[\exp[\mathcal{C}_{M,r,\tau_0}'(t+1)]]] - \exp[\exp[\exp[-\mathcal{C}_{M,r}'(t+1)]]]\right]
$$
  

$$
< \frac{\tau_0}{2C_r\left((1+\frac{1}{\nu^{1/2}})\|\widetilde{V}_0\|_{\frac{3}{2}+\delta,0,0}+\frac{1}{|\Omega_0|^{1/2}}(1+\nu+\frac{1}{\nu^{3/2}})\right)},
$$
(5.39)

or equivalently, under the assumption of [\(5.2\)](#page-22-4), for some  $C''_{M,r,\tau_0} \in (1,\infty)$ ,

$$
\exp\left[(1+\nu+\frac{1}{\nu})\exp\left[\exp\left[\mathcal{C}_{M,r,\tau_{0}}''(t+1)\right]\right]\right]-\exp\left[\exp\left[-\mathcal{C}_{M,r,\tau_{0}}''(t+1)\right]\right]\right] \n<\frac{C_{M,r,\tau_{0}}''|\Omega_{0}|^{1/2}}{1+\nu+\frac{1}{\nu^{3/2}}},
$$
\n(5.40)

it follows that  $\tau(t) > 0$ . In particular, for  $t \in (0, T]$  with

$$
T = \frac{1}{C_{M,r,\tau_0}''} \log \left[ \frac{1}{e^{C_{M,r,\tau_0}''}} \log \left[ \log \left[ \frac{\log \left( \frac{C_{M,r,\tau_0}'' |\Omega_0|^{1/2}}{1 + \nu + \frac{1}{\nu^{3/2}}} \right)}{1 + \nu + \frac{1}{\nu}} \right] \right] \right],
$$
(5.41)

the above inequality is satisfied.

Consequently, under condition  $(5.2)$ ,  $(5.36)$  and  $(5.39)$  imply  $(5.3)$ , and  $(5.37)$  implies  $(5.4)$  thanks to [\(5.5\)](#page-23-5). This completes the proof of Theorem [5.1.](#page-21-0)

## <span id="page-31-1"></span>**5.3. Proof of Theorem [5.2](#page-22-1)**

In this section, we prove Theorem [5.2.](#page-22-1) We only sketch the proof for the first two parts, and will provide detailed proof for the third part.

For the first part of the theorem, thanks to Remark [8,](#page-21-5) we know that when  $\sup_{0\leq t<\infty} \|\overline{V}(t)\|_{r+3,0,\tau(t)} \leq$  $C_{M,r}$  the growth of  $\|\widetilde{V}(t)\|_{r+2,1,\tau(t)}$  will only be exponentially in time. Thus, the function  $\mathcal{K}(t)$  appears in the proof of Theorem [5.1](#page-21-0) (e.g.,  $(5.29)$  and  $(5.35)$ ) becomes only exponentially in time. This reduces two logarithms in the estimate of existence time and gives

$$
\mathcal{T} = \frac{1}{C_{\tau_0, M, r, \nu}} \log(\log(|\Omega_0|)).
$$

This can be seen as in  $(5.36) - (5.39)$  $(5.36) - (5.39)$  $(5.36) - (5.39)$ .

Similarly, for the second part of Theorem [5.2,](#page-22-1) thanks to Remark [8,](#page-21-5) when  $\sup_{0\leq t\leq\infty} \|\overline{V}(t)\|_{r+3,0,\tau} \leq$  $\frac{\nu}{4C_{r,\alpha}}$  is small enough  $\|\widetilde{V}(t)\|_{r+2,1,\tau(t)}$  does not grow and thus the function  $\mathcal{K}(t)$  is uniformly-in-time bounded. This reduces one more logarithm and gives

**73** Page 32 of [44](#page-42-1) Q. Lin et al. JMFM

$$
\mathcal{T} = \frac{1}{C_{\tau_0, M, r, \nu}} \log(|\Omega_0|)).
$$

To show that the smallness condition  $(5.2)$  can be relaxed, recalling K in  $(5.27)$ . Under our new assumption on  $\overline{V}$ , thanks to Remark [8,](#page-21-5) we have that  $K^{\frac{1}{2}} \leq \frac{\nu}{C_{r,\alpha}} + C_M e^{-\frac{\nu}{2}t}$  and  $||V_+(t)||_{3/2+\delta,1,0} + ||V_-(t)||_{3/2+\delta,1,0} \leq \frac{\tau_0}{C_{r,\nu,M}} e^{-\frac{\nu}{2}t}$ . Now recall from [\(5.38\)](#page-31-0) that

$$
\tau(t) = \left(\tau_0 - C_r \int_0^t e^{C_r \int_0^{t'} K^{\frac{1}{2}}(s) ds} \left( \|V_+\|_{3/2 + \delta, 1, 0} + \|V_-\|_{3/2 + \delta, 1, 0} + F^{\frac{1}{2}} + H^{\frac{1}{2}} \right) dt' \right) e^{-C_r \int_0^t K^{\frac{1}{2}}(t') dt'},
$$

in which we will ask for

$$
\tau_0 - C_r \int_0^t e^{C_r \int_0^{t'} K^{\frac{1}{2}}(s) ds} (\|V_+\|_{3/2 + \delta, 1, 0} + \|V_-\|_{3/2 + \delta, 1, 0}) dt' \ge \tau_0 - C_r \int_0^\infty C_{M, \nu} \frac{\tau_0}{C_{r, \nu, M}} e^{\frac{C_r}{C_{r, \alpha}} \nu t' - \frac{\nu}{2} t'} dt' \ge \frac{\tau_0}{2},
$$

provided that  $C_{r,\nu,M}$  and  $C_{r,\alpha}$  are large enough. From this, one can conclude that the smallness assumption can be relaxed and replaced by  $\|\widetilde{\mathcal{V}}_0\|_{\frac{3}{2}+\delta,0,0} \leq \frac{\tau_0}{C_{r,\nu,M}}$ .

Next we give the detailed proof to the third part of Theorem [5.2.](#page-22-1) Consider the initial data satisfying  $\|\overline{\mathcal{V}}_0\|_{r+3,0,\tau_0} \leq \frac{M}{|\Omega|_0}$ . We set  $\overline{V} = 0$  and replace the initial condition [\(5.8\)](#page-23-4) of the perturbed system to

$$
\overline{\phi}_0 = \overline{\mathcal{V}}_0, \quad (\phi_\pm)_0 = 0.
$$

With more careful estimates,  $(5.23)$  becomes

<span id="page-32-0"></span>
$$
\frac{d}{dt}F + \nu H \le \left[\dot{\tau} + C_r K^{\frac{1}{2}} \tau + C_r \left(\|V_+\|_{\frac{3}{2} + \delta, 1, 0} + \|V_-\|_{\frac{3}{2} + \delta, 1, 0}\right) \right.\n+ C_r F^{\frac{1}{2}} + C_r H^{\frac{1}{2}}\right] \times G + C_{r, \nu} LF \n+ \frac{C_{r, \nu}}{|\Omega|} KH + \frac{C_{r, \nu}}{|\Omega|} \left(\|\partial_z V_+\|_{r, 1, \tau} + \|\partial_z V_-\|_{r, 1, \tau}\right) K^{\frac{1}{2}} H^{\frac{1}{2}} \n+ \frac{C_{r, \nu, \tau_0}}{|\Omega|} L + \frac{C_{r, \nu}}{|\Omega|} \partial_t N,
$$
\n(5.42)

where  $\delta \in (0, \frac{1}{2})$  and  $F, G, H$  are defined as in  $(5.24)$ – $(5.26)$ ,

$$
K := \|V_{+}\|_{r+2,0,\tau}^2 + \|V_{-}\|_{r+2,0,\tau}^2 + \|V_{+}\|_{r+1,1,\tau}^2 + \|V_{-}\|_{r+1,1,\tau}^2, \quad L := K^{\frac{1}{2}} + K + K^2,
$$

and

<span id="page-32-2"></span>
$$
\dot{\tau} + C_r K^{\frac{1}{2}} \tau + C_r \left( \|V_+ \|_{\frac{3}{2} + \delta, 1, 0} + \|V_- \|_{\frac{3}{2} + \delta, 1, 0} \right) + C_r F^{\frac{1}{2}} + C_r H^{\frac{1}{2}} = 0. \tag{5.43}
$$

On the other hand, thanks to Remark [8,](#page-21-5) [\(4.8\)](#page-18-9), and [\(4.9\)](#page-18-8), there exist  $C_{M,\nu}, C_r, C > 1$  such that

<span id="page-32-3"></span>
$$
L \le C_M e^{-\frac{\nu}{C}t} =: \mathcal{K}(t),\tag{5.44}
$$

<span id="page-32-4"></span>
$$
\nu \int_0^t \left( \|\partial_z V_+(s)\|_{r,1,\tau}^2 + \|\partial_z V_-(s)\|_{r,1,\tau}^2 \right) e^{\nu s} ds \le C_M \quad \text{and} \quad (5.45)
$$

$$
\nu \int_0^t \left( \|V_+(s)\|_{\frac{3}{2}+\delta,1,0}^2 + \|V_-(s)\|_{\frac{3}{2}+\delta,1,0}^2 \right) e^{\nu s} ds \le C \|\widetilde{V}_0\|_{\frac{3}{2}+\delta,0,0}^2. \tag{5.46}
$$

With these conditions, from  $(5.42)$ , one can derive that

$$
\frac{d}{dt}F + \nu H \leq C_{r,\nu}LF + \frac{C_{r,\nu}}{|\Omega|}(\mathcal{K} + 1)H + \frac{C_{r,\nu}}{|\Omega|^2}(\|\partial_z V_+\|_{r,1,\tau}^2 + \|\partial_z V_-\|_{r,1,\tau}^2)\mathcal{K} + \frac{C_{r,\nu,\tau_0}}{|\Omega|}L + \frac{C_{r,\nu}}{|\Omega|}\partial_t N,
$$

and thus

<span id="page-32-1"></span>
$$
\frac{d}{dt}F + \frac{\nu}{2}H \leq C_{r,\nu}LF + \frac{C_{r,\nu}}{|\Omega|^2} \left( \|\partial_z V_+\|_{r,1,\tau}^2 + \|\partial_z V_-\|_{r,1,\tau}^2 \right) \mathcal{K} + \frac{C_{r,\nu,\tau_0}}{|\Omega|} L + \frac{C_{r,\nu}}{|\Omega|} \partial_t N,\tag{5.47}
$$

provided that  $|\Omega| > C_{M,r,\nu}$  for some positive constant  $C_{M,r,\nu} > 0$ . Multiplying  $(5.47)$  with  $e^{-C_{r,\nu} \int_0^t L(s) ds}$ leads to

$$
\frac{d}{dt} \left( F e^{-C_{r,\nu} \int_0^t L(s) \, ds} \right) + \frac{\nu}{2} H e^{-C_{r,\nu} \int_0^t L(s) \, ds} \leq \frac{C_{r,\nu}}{|\Omega|^2} \left( \|\partial_z V_+ \|_{r,1,\tau}^2 + \|\partial_z V_-\|_{r,1,\tau}^2 \right) \mathcal{K} e^{-C_{r,\nu} \int_0^t L(s) \, ds} \n+ \frac{C_{r,\nu, \tau_0}}{|\Omega|} L e^{-C_{r,\nu} \int_0^t L(s) \, ds} + \frac{C_{r,\nu}}{|\Omega|} \partial_t N e^{-C_{r,\nu} \int_0^t L(s) \, ds}.
$$

After integrating the above equation in time and recalling that  $F(t = 0) \leq \frac{M}{|\Omega_0|}$ , since  $|\Omega| > |\Omega_0| > 1$ , one obtains

<span id="page-33-0"></span>
$$
(F(t)e^{-C_{r,\nu}\int_{0}^{t}L(s)ds}) + \int_{0}^{t}\frac{\nu}{2}H(t')e^{-C_{r,\nu}\int_{0}^{t'}L(s)ds}dt'
$$
  
\n
$$
\leq \frac{C_{M}}{|\Omega_{0}|} + \int_{0}^{t}\frac{C_{r,\nu}}{|\Omega_{0}|}(\|\partial_{z}V_{+}(t')\|_{r,1,\tau}^{2} + \|\partial_{z}V_{-}(t')\|_{r,1,\tau}^{2})Ke^{-C_{r,\nu}\int_{0}^{t'}L(s)ds}dt'
$$
  
\n
$$
+ \int_{0}^{t}\frac{C_{r,\nu,\tau_{0}}}{|\Omega_{0}|}L(t')e^{-C_{r,\nu}\int_{0}^{t'}L(s)ds}dt' + \int_{0}^{t}\frac{C_{r,\nu}}{|\Omega_{0}|}\partial_{t}N(t')e^{-C_{r,\nu}\int_{0}^{t'}L(s)ds}dt'
$$
  
\n
$$
\leq \frac{C_{M,r,\nu,\tau_{0}}}{|\Omega_{0}|} + \frac{C_{r,\nu}}{|\Omega_{0}|}\int_{0}^{t}\partial_{t}N(t')e^{-C_{r,\nu}\int_{0}^{t'}L(s)ds}dt'.
$$
\n(5.48)

According to [\(5.34\)](#page-30-5), since now  $N(0) \neq 0$  due to  $\overline{\phi}_0 \neq 0$ , the estimate becomes

$$
\int_0^t \partial_t N(t') e^{-C_{r,\nu} \int_0^{t'} L(s) ds} dt' = N(t) e^{-C_{r,\nu} \int_0^t (\mathcal{K}^2 + 1)(s) ds} - N(0)
$$
  
+  $C_{r,\nu} \int_0^t N(t') L(t') e^{-C_{r,\nu} \int_0^{t'} L(s) ds} dt'$   

$$
\leq C_{M,r,\nu} \left( F^{\frac{1}{2}}(t) + 1 \right) + C_{r,\nu} \int_0^t \mathcal{K}(t') F^{\frac{1}{2}}(t') dt'.
$$

Hence, [\(5.48\)](#page-33-0) implies that, for  $t \in [0, T]$ , after applying the young inequality, one has

<span id="page-33-1"></span>
$$
F(t) + \int_0^t H(t') dt' \le \frac{C_{M,r,\nu,\tau_0}}{|\Omega_0|},\tag{5.49}
$$

where  $\mathcal{T} \in (0,\infty]$  is given by the constraint

$$
\tau(s) > 0 \quad \text{for} \quad s \in [0, T].
$$

Now we will be able to estimate T. To ensure  $\tau > 0$ , from  $(5.43)$ ,  $(5.44)$ ,  $(5.46)$ , and  $(5.49)$ , one has

$$
\tau(t) = -C_r \int_0^t e^{-C_r \int_{t'}^t K^{\frac{1}{2}}(s) ds} \left( \|V_+\|_{3/2 + \delta, 1, 0} + \|V_-\|_{3/2 + \delta, 1, 0} + F^{\frac{1}{2}} + H^{\frac{1}{2}} \right) dt' + \tau_0 e^{-C_r \int_0^t K^{\frac{1}{2}}(t') dt'}
$$
(5.50)

$$
\geq \tau_0 C_{M,r,\nu}^{\prime} - C_{M,r,\nu,\tau_0}^{\prime} \frac{1}{|\Omega_0|^{\frac{1}{2}}}(t+1) - C_{r,\nu} \|\widetilde{V}_0\|_{\frac{3}{2} + \delta,0,0}
$$

for some constant  $\mathcal{C}_{M,r,\nu}$   $\in (0,1), \mathcal{C}_{r,\nu}, \mathcal{C}_{M,r,\nu,\tau_0}'$   $\in (1,\infty)$ . Therefore, for  $t > 0$  satisfying

<span id="page-33-2"></span>
$$
t + 1 < \frac{C'_{M,r,\nu} \tau_0 |\Omega_0|^{\frac{1}{2}}}{2C'_{M,r,\nu,\tau_0}} \tag{5.51}
$$

and  $||V_0||_{\frac{3}{2}+\delta,0,0}$  satisfying

$$
\|\widetilde{V}_0\|_{\frac{3}{2}+\delta,0,0} < \frac{\tau_0 C_{M,r,\nu}'}{2C_{r,\nu}},
$$

it follows that  $\tau(t) > 0$ . Consequently, [\(5.51\)](#page-33-2) implies  $\mathcal{T} = \frac{|\Omega_0|^{\frac{1}{2}}}{C_{\tau_0, M, r, \nu}}$ . This completes the proof of Theorem [5.2.](#page-22-1)

#### <span id="page-34-1"></span>**6.** Global Existence in  $2D$  with  $\Omega = 0$

In this section, we show that the weak solution obtained in section [3](#page-9-2) exists globally in time in the case of 2D and  $\Omega = 0$ , provided that the initial data is small. This result is similar to the one in [\[46\]](#page-43-18), where system  $(1.1)$  with Dirichlet boundary condition is considered.

To be more precious, let us consider  $\mathcal{V} = (u, v)^{\top}(x, z, t)$  with [\(2.7\)](#page-5-1), i.e., the solution to system [\(1.1\)](#page-1-0) independent of the y-variable. It is easy to verify that

$$
\overline{u} = 0,\tag{6.1a}
$$

<span id="page-34-2"></span>
$$
\partial_t \overline{v} + \partial_x \mathfrak{P}_0(\widetilde{u}\widetilde{v}) = 0,\tag{6.1b}
$$

$$
\partial_t \widetilde{u} + \widetilde{u}\partial_x \widetilde{u} - \partial_x \mathfrak{P}_0(\widetilde{u}^2) - \left(\int_0^z \partial_x \widetilde{u}(x, s) ds\right) \partial_z \widetilde{u} - \Omega \widetilde{v} - \nu \partial_{zz} \widetilde{u} = 0,\tag{6.1c}
$$

$$
\partial_t \widetilde{v} + \widetilde{u} \partial_x \widetilde{v} + \widetilde{u} \partial_x \overline{v} - \partial_x \mathfrak{P}_0(\widetilde{u}\widetilde{v}) - \left(\int_0^z \partial_x \widetilde{u}(x, s) ds\right) \partial_z \widetilde{v} + \Omega \widetilde{u} - \nu \partial_{zz} \widetilde{v} = 0. \tag{6.1d}
$$

We remind readers that  $\mathfrak{P}_0$  is the barotropic projection operator defined in [\(2.14\)](#page-6-6). In addition, let  $\Omega = 0$ . Then one can observe that  $\overline{v} \equiv 0$  and  $\widetilde{v} \equiv 0$  are invariant in time, a property that is not true in the case of  $\Omega \neq 0$ . Consequently, with  $\Omega = 0$  and  $\overline{v}_0 = \widetilde{v}_0 = 0$ , system [\(6.1\)](#page-34-2) reduces to

<span id="page-34-3"></span>
$$
\partial_t \widetilde{u} + \widetilde{u}\partial_x \widetilde{u} - \partial_x \mathfrak{P}_0(\widetilde{u}^2) - \left(\int_0^z \partial_x \widetilde{u}(x,s)ds\right) \partial_z \widetilde{u} - \nu \partial_{zz}\widetilde{u} = 0 \quad \text{with} \quad \partial_z \widetilde{u}|_{z=0,1}.\tag{6.2}
$$

<span id="page-34-0"></span>We have the following theorem concerning the global existence of the weak solutions to [\(6.2\)](#page-34-3) with  $\Omega = 0$ :

**Theorem 6.1.** *For*  $r > 2$  *and*  $\tau_0 > 0$ *, suppose that the initial data*  $\tilde{u}|_{t=0} = \tilde{u}_0 \in \mathcal{S}_{r,0,\tau_0}$  with  $\int_0^1 \tilde{u}_0(x, z) dz = 0$  satisfies the smallness condition 0 *satisfies the smallness condition*

<span id="page-34-5"></span>
$$
\|\widetilde{u}_0\|_{r,0,\tau_0} < \frac{\nu \tau_0}{\mathcal{C}_r},\tag{6.3}
$$

*where*  $C_r > 0$  *is a constant as in [\(6.5\)](#page-35-1), below. Then the unique weak solution to system [\(6.2\)](#page-34-3) exists globally in time.*

*Proof.* (Sketch of proof) Similarly to  $(3.1)$ , we have

$$
\frac{1}{2} \frac{d}{dt} \|\widetilde{u}\|_{r,0,\tau}^2 + \nu \|\partial_z \widetilde{u}\|_{r,0,\tau}^2 = \dot{\tau} \|A^{r+\frac{1}{2}} e^{\tau A} \widetilde{u}\|^2 - \left\langle A^r e^{\tau A} \widetilde{u} \partial_x \widetilde{u}, A^r e^{\tau A} \widetilde{u} \right\rangle \n- \left\langle A^r e^{\tau A} \left( \int_0^z \partial_x \widetilde{u}(x,s) ds \right) \partial_z \widetilde{u}, A^r e^{\tau A} \widetilde{u} \right\rangle \n\leq \left( \dot{\tau} + C_r (\|\widetilde{u}\|_{r,0,\tau} + \|\partial_z \widetilde{u}\|_{r,0,\tau}) \right) \|A^{r+\frac{1}{2}} e^{\tau A} \widetilde{u}\|^2,
$$

thanks to Lemma [A.1](#page-35-0) and Lemma [A.2.](#page-37-0)

It is easy to see that  $\int_0^1 \widetilde{u}(x, z) dz = 0$ . One can apply the Poincaré inequality to get  $||\widetilde{u}||_{r, 0, \tau} \le$  $\|\partial_z \widetilde{u}\|_{r,0,\tau}$ , and consequently,

$$
\frac{1}{2}\frac{d}{dt}\|\widetilde{u}\|_{r,0,\tau}^2 + \frac{\nu}{2}\|\partial_z \widetilde{u}\|_{r,0,\tau}^2 \leq \left(\dot{\tau} + C_r \|\partial_z \widetilde{u}\|_{r,0,\tau}\right) \|A^{r+\frac{1}{2}}e^{\tau A}\widetilde{u}\|^2 - \frac{\nu}{2}\|\widetilde{u}\|_{r,0,\tau}^2.
$$

Assuming that

<span id="page-34-4"></span>
$$
\dot{\tau} + C_r ||\partial_z \tilde{u}||_{r,0,\tau} = 0,\tag{6.4}
$$

one has

$$
\frac{d}{dt} \|\widetilde{u}\|_{r,0,\tau}^2 + \nu \|\partial_z \widetilde{u}\|_{r,0,\tau}^2 \leq -\nu \|\widetilde{u}\|_{r,0,\tau}^2.
$$

After applying the Grönwall inequality, one obtains

$$
\|\widetilde{u}(t)\|_{r,0,\tau(t)}^2 e^{\nu t} + \nu \int_0^t \|\partial_z \widetilde{u}(s)\|_{r,0,\tau(s)}^2 e^{\nu s} ds \le \|\widetilde{u}_0\|_{r,0,\tau_0}^2.
$$

Therefore, integrating [\(6.4\)](#page-34-4) from 0 to  $t \in (0,\infty)$  and applying the Hölder inequality in the resultant lead to

<span id="page-35-1"></span>
$$
\tau(t) = \tau_0 - C_r \int_0^t \|\partial_z \widetilde{u}(s)\|_{r,0,\tau(s)} ds
$$
  
\n
$$
\geq \tau_0 - C_r \Big(\int_0^t \|\partial_z \widetilde{u}(s)\|_{r,0,\tau(s)}^2 e^{\nu s} ds\Big)^{\frac{1}{2}} \Big(\int_0^t e^{-\nu s} ds\Big)^{\frac{1}{2}}
$$
  
\n
$$
\geq \tau_0 - \frac{C_r}{\nu} \|\widetilde{u}_0\|_{r,0,\tau_0},
$$
\n(6.5)

for some positive constant  $\mathcal{C}_r \in (0,\infty)$ .

In summary, for the initial data satisfying [\(6.3\)](#page-34-5), we have that  $\tau(t) > 0$  for all  $t > 0$ , and thus the solution exists for all time.  $\Box$

### **Appendix A. Estimates of Nonlinear Terms**

<span id="page-35-0"></span>In this appendix, we list the estimates of nonlinear terms in the analytic-Sobolev spaces  $S_{r,s,\tau}$ . Lemma [A.1](#page-35-0)[–A.2](#page-37-0) will be used to prove the local well-posedness, and similar estimates can be found in [\[23](#page-42-9)[,28](#page-43-23)].

**Lemma A.1.** *For*  $f, g, h \in S_{r+\frac{1}{2},s,\tau}$ *, where*  $r > 1$ *,*  $s \geq 0$ *, and*  $\tau \geq 0$ *, one has* 

$$
\left| \left\langle A^r e^{\tau A} (f \cdot \nabla g), A^r e^{\tau A} h \right\rangle \right|
$$
  
\n
$$
\leq \int_0^1 C_r \left[ (\| A^r e^{\tau A} f(z) \|_{L^2(\mathbb{T}^2)} + |\hat{f}_0(z)|) \| A^{r + \frac{1}{2}} e^{\tau A} g(z) \|_{L^2(\mathbb{T}^2)} \| A^{r + \frac{1}{2}} e^{\tau A} h(z) \|_{L^2(\mathbb{T}^2)} \right]
$$
  
\n
$$
+ \| A^{r + \frac{1}{2}} e^{\tau A} f(z) \|_{L^2(\mathbb{T}^2)} \| A^{r + \frac{1}{2}} e^{\tau A} g(z) \|_{L^2(\mathbb{T}^2)} \| A^r e^{\tau A} h(z) \|_{L^2(\mathbb{T}^2)} \right] dz.
$$
 (A.1)

*Proof.* First, notice that  $\left\langle A^r e^{\tau A} (f \cdot \nabla g), A^r e^{\tau A} h \right\rangle =$ *Proof.* First, notice that  $\left| \left\langle A^r e^{\tau A} (f \cdot \nabla g), A^r e^{\tau A} h \right\rangle \right| = \left| \left\langle f \cdot \nabla g, A^r e^{\tau A} H \right\rangle \right|$ , where  $H = A^r e^{\tau A} h$ . Using the Fourier representation, we have,

<span id="page-36-0"></span>
$$
f(\mathbf{x}, z) = \sum_{j \in 2\pi \mathbb{Z}^2} \hat{f}_j(z) e^{ij \cdot \mathbf{x}}, \tag{A.2a}
$$

$$
g(\mathbf{x}, z) = \sum_{\mathbf{k} \in 2\pi \mathbb{Z}^2} \hat{g}_{\mathbf{k}}(z) e^{i\mathbf{k} \cdot \mathbf{x}},\tag{A.2b}
$$

$$
h(\boldsymbol{x}, z) = \sum_{l \in 2\pi \mathbb{Z}^2} \hat{h}_l(z) e^{il \cdot x}, \quad \text{and by definition,}
$$
 (A.2c)

$$
A^r e^{\tau A} H(x, z) = \sum_{l \in 2\pi \mathbb{Z}^2} |l|^r e^{\tau |l|} \hat{H}_l(z) e^{il \cdot x}, \quad \text{with} \quad \hat{H}_l(z) = |l|^r e^{\tau |l|} \hat{h}_l(z). \tag{A.2d}
$$

Therefore,

$$
\left|\left\langle f \cdot \nabla g, A^r e^{\tau A} H \right\rangle\right| \leq \int_0^1 \sum_{j+k+l=0} |\hat{f}_j(z)| |k| |\hat{g}_k(z)| |l|^r e^{\tau |l|} |\hat{H}_l(z)| dz.
$$

Since  $|\mathbf{l}| = |\mathbf{j} + \mathbf{k}| \le |\mathbf{j}| + |\mathbf{k}|$ , we have the following inequalities:

$$
|\bm{l}|^r \le (|\bm{j}| + |\bm{k}|)^r \le C_r(|\bm{j}|^r + |\bm{k}|^r), \quad e^{\tau|\bm{l}|} \le e^{\tau|\bm{j}|}e^{\tau|\bm{k}|}.
$$

Applying these inequalities, we have

$$
\left|\left\langle f\cdot\nabla g,A^r e^{\tau A}H\right\rangle\right|\leq\int_0^1\sum_{j+k+l=0}C_r|\hat{f}_j(z)||\mathbf{k}||\hat{g}_k(z)|(|j|^r+|\mathbf{k}|^r)e^{\tau|j|}e^{\tau|\mathbf{k}|}|\mathbf{l}|^r e^{\tau|\mathbf{l}|}|\hat{h}_l(z)|dz.
$$

Since  $|\mathbf{k}|, |\mathbf{j}|, |\mathbf{l}| \ge 0$ , we have  $|\mathbf{k}|^{\frac{1}{2}} \le (|\mathbf{j}| + |\mathbf{l}|)^{\frac{1}{2}} \le |\mathbf{j}|^{\frac{1}{2}} + |\mathbf{l}|^{\frac{1}{2}}$ , therefore,

$$
\left| \left\langle f \cdot \nabla g, A^r e^{\tau A} H \right\rangle \right|
$$
  
\n
$$
\leq \int_0^1 \sum_{j+k+l=0} C_r |\hat{f}_j(z)| |k|^{\frac{1}{2}} (|j|^{\frac{1}{2}} + |l|^{\frac{1}{2}}) |\hat{g}_k(z)| (|j|^r + |k|^r) e^{\tau |j|} e^{\tau |k|} |l|^r e^{\tau |l|} |\hat{h}_l(z)| dz
$$
  
\n
$$
\leq \int_0^1 \sum_{j+k+l=0} C_r (|k|^{\frac{1}{2}} |j|^{r+\frac{1}{2}} |l|^r + |k|^{r+\frac{1}{2}} |j|^{\frac{1}{2}} |l|^r + |k|^{\frac{1}{2}} |j|^r |l|^{r+\frac{1}{2}} + |k|^{r+\frac{1}{2}} |l|^{r+\frac{1}{2}})
$$
  
\n
$$
\times e^{\tau |j|} e^{\tau |k|} e^{\tau |l|} |\hat{f}_j(z)| |\hat{g}_k(z)| |\hat{h}_l(z)| dz =: \int_0^1 (A_1 + A_2 + A_3 + A_4)(z) dz.
$$

Thanks to Cauchy-Schwarz inequality, since  $r > 1$ , we have

$$
A_{1} = \sum_{j+k+l=0} C_{r} |k|^{\frac{1}{2}} |j|^{r+\frac{1}{2}} |l|^{r} e^{\tau |j|} e^{\tau |k|} e^{\tau |l|} |\hat{f}_{j}(z)||\hat{g}_{k}(z)||\hat{h}_{l}(z)|
$$
  
\n
$$
= C_{r} \sum_{\substack{k \in 2\pi \mathbb{Z}^{2} \\ k \neq 0}} \left[ |k|^{\frac{1}{2}} |\hat{g}_{k}(z)| e^{\tau |k|} \sum_{\substack{j \in 2\pi \mathbb{Z}^{2} \\ j \neq 0, -k}} |j|^{r+\frac{1}{2}} e^{\tau |j|} |\hat{f}_{j}(z)||j+k|^{r} e^{\tau |j+k|} |\hat{h}_{-j-k}(z)| \right]
$$
  
\n
$$
\leq C_{r} \Big( \sum_{\substack{k \in 2\pi \mathbb{Z}^{2} \\ k \neq 0}} |k|^{-2r} \Big)^{\frac{1}{2}} \Big( \sum_{\substack{k \in 2\pi \mathbb{Z}^{2} \\ k \neq 0}} |k|^{2r+1} e^{2\tau |k|} |\hat{g}_{k}(z)|^{2} \Big)^{\frac{1}{2}}
$$
  
\n
$$
\times \sup_{k \in 2\pi \mathbb{Z}^{2}} \Big[ \Big( \sum_{\substack{j \in 2\pi \mathbb{Z}^{2} \\ j \neq 0, -k}} |j|^{2r+1} e^{2\tau |j|} |\hat{f}_{j}(z)|^{2} \Big)^{\frac{1}{2}} \Big( \sum_{\substack{j \in 2\pi \mathbb{Z}^{2} \\ j \neq 0, -k}} |j+k|^{2r} e^{2\tau |j+k|} |\hat{h}_{-j-k}(z)|^{2} \Big)^{\frac{1}{2}} \Big]
$$
  
\n
$$
\leq C_{r} ||A^{r+\frac{1}{2}} e^{\tau A} f(z)||_{L^{2}(\mathbb{T}^{2})} ||A^{r+\frac{1}{2}} e^{\tau A} g(z)||_{L^{2}(\mathbb{T}^{2})} ||A^{r} e^{\tau A} h(z)||_{L^{2}(\mathbb{T}^{2})}.
$$

Similarly, we have

$$
A_2 = \sum_{j+k+l=0} C_r |k|^{r+\frac{1}{2}} |j|^{\frac{1}{2}} |l|^{r} e^{\tau |j|} e^{\tau |k|} e^{\tau |l|} |\hat{f}_j(z)| |\hat{g}_k(z)| |\hat{h}_l(z)|
$$
  

$$
\leq C_r \|A^{r+\frac{1}{2}} e^{\tau A} f(z) \|_{L^2(\mathbb{T}^2)} \|A^{r+\frac{1}{2}} e^{\tau A} g(z) \|_{L^2(\mathbb{T}^2)} \|A^{r} e^{\tau A} h(z) \|_{L^2(\mathbb{T}^2)},
$$

and

$$
A_3 = \sum_{j+k+l=0} C_r |\mathbf{k}|^{\frac{1}{2}} |\mathbf{j}|^r |\mathbf{l}|^{r+\frac{1}{2}} e^{\tau |\mathbf{j}|} e^{\tau |\mathbf{k}|} e^{\tau |\mathbf{l}|} |\hat{f}_j(z)| |\hat{g}_k(z)| |\hat{h}_l(z)|
$$
  

$$
\leq C_r \|A^r e^{\tau A} f(z)\|_{L^2(\mathbb{T}^2)} \|A^{r+\frac{1}{2}} e^{\tau A} g(z)\|_{L^2(\mathbb{T}^2)} \|A^{r+\frac{1}{2}} e^{\tau A} h(z)\|_{L^2(\mathbb{T}^2)}.
$$

For  $A_4$ , thanks to Cauchy-Schwarz inequality, since  $r > 1$ , we have

$$
A_{4} = \sum_{j+k+l=0} C_{r} |k|^{r+\frac{1}{2}} |l|^{r+\frac{1}{2}} e^{\tau |j|} e^{\tau |k|} e^{\tau |l|} |\hat{f}_{j}(z)| |\hat{g}_{k}(z)| |\hat{h}_{l}(z)|
$$
  
\n
$$
= C_{r} \sum_{j \in 2\pi \mathbb{Z}^{2}} \left[ e^{\tau |j|} |\hat{f}_{j}(z)| \sum_{\substack{k \in 2\pi \mathbb{Z}^{2} \\ k \neq 0, -j}} |k|^{r+\frac{1}{2}} |\hat{g}_{k}(z)| e^{\tau |k|} |j+k|^{r+\frac{1}{2}} e^{\tau |j+k|} |\hat{h}_{-j-k}| \right]
$$
  
\n
$$
\leq C_{r} \left\{ |\hat{f}_{0}(z)| + \Big( \sum_{\substack{j \in 2\pi \mathbb{Z}^{2} \\ j \neq 0}} |j|^{-2r} \Big)^{\frac{1}{2}} \Big( \sum_{\substack{j \in 2\pi \mathbb{Z}^{2} \\ j \neq 0}} |j|^{2r} e^{2\tau |j|} |\hat{f}_{j}(z)|^{2} \Big)^{\frac{1}{2}} \right\}
$$
  
\n
$$
\times \sup_{j \in 2\pi \mathbb{Z}^{2}} \left[ \Big( \sum_{\substack{k \in 2\pi \mathbb{Z}^{2} \\ k \neq 0, -j}} |k|^{2r+1} e^{2\tau |k|} |\hat{g}_{k}(z)|^{2} \Big)^{\frac{1}{2}} \Big( \sum_{\substack{k \in 2\pi \mathbb{Z}^{2} \\ k \neq 0, -j}} |j+k|^{2r+1} e^{2\tau |j+k|} |\hat{h}_{-j-k}|^{2} \Big)^{\frac{1}{2}} \right]
$$
  
\n
$$
\leq C_{r} (\|A^{r} e^{\tau A} f(z)\|_{L^{2}(\mathbb{T}^{2})} + |\hat{f}_{0}(z)|) \|A^{r+\frac{1}{2}} e^{\tau A} g(z) \|_{L^{2}(\mathbb{T}^{2})} \|A^{r+\frac{1}{2}} e^{\tau A} h(z) \|_{L^{2}(\mathbb{T}^{2})}.
$$

Combining the estimates for  $A_1$  to  $A_4$ , we achieve the desired inequality.

<span id="page-37-0"></span>**Lemma A.2.** *For*  $f, h \in S_{r+\frac{1}{2},s,\tau}$  *and*  $g, \partial_z g \in S_{r,s,\tau}$ *, where*  $r > \frac{3}{2}$ *, s*  $\geq 0$ *, and*  $\tau \geq 0$ *, one has* 

$$
\left| \left\langle A^r e^{\tau A} \left( \left( \int_0^z \nabla \cdot f(x, s) ds \right) \partial_z g \right), A^r e^{\tau A} h \right\rangle \right|
$$
  

$$
\leq C_r \|A^{r + \frac{1}{2}} e^{\tau A} f\| \|\partial_z g\|_{r,0,\tau} \|A^{r + \frac{1}{2}} e^{\tau A} h\|.
$$

**Birkhäuser** 

 $\Box$ 

*Proof.* First,  $\langle A^r e^{\tau A} ((\int_0^z \nabla \cdot f(\boldsymbol{x}, s) ds) \partial_z g), A^r e^{\tau A} h \rangle =$ Proof. First,  $\left| \left\langle A^r e^{\tau A} \left( \left( \int_0^z \nabla \cdot f(x,s) ds \right) \partial_z g \right), A^r e^{\tau A} h \right\rangle \right| = \left| \left\langle \left( \int_0^z \nabla \cdot f(x,s) ds \right) \partial_z g, A^r e^{\tau A} H \right\rangle \right|$ . Owing to the Fourier representation in [\(A.2\)](#page-36-0), we have

$$
\left| \left\langle \left( \int_0^z \nabla \cdot f(x, s) ds \right) \partial_z g, A^r e^{\tau A} H \right\rangle \right| = \left| \left\langle \int_0^z \sum_{j \in 2\pi \mathbb{Z}^2} \mathbf{j} \cdot \hat{f}_j(s) e^{ij \cdot x} ds \right) \partial_z g, A^r e^{\tau A} H \right\rangle \right|
$$
  
\n
$$
\leq \int_0^1 \sum_{j+k+l=0} C_r |j| \left( \int_0^z |\hat{f}_j(s)| ds \right) |\partial_z \hat{g}_k(z)| (|j|^r + |k|^r) e^{\tau |j|} e^{\tau |k|} |l|^r e^{\tau |l|} |\hat{h}_l(z)| dz
$$
  
\n
$$
\leq \int_0^1 \sum_{j+k+l=0} C_r \left( |\mathbf{k}|^{\frac{1}{2}} |j|^{r+\frac{1}{2}} |l|^r + |j|^{r+\frac{1}{2}} |l|^{r+\frac{1}{2}} + |j| |k|^r |l|^r \right)
$$
  
\n
$$
\times e^{\tau |j|} e^{\tau |k|} e^{\tau |l|} \left( \int_0^z |\hat{f}_j(s)| ds \right) |\partial_z \hat{g}_k(z)| |\hat{h}_l(z)| dz =: B_1 + B_2 + B_3.
$$

where we have substituted the following inequalities: for  $j + k + l = 0$ ,

$$
|\boldsymbol{j}|^{\frac{1}{2}} \leq (|\boldsymbol{k}|^{\frac{1}{2}} + |\boldsymbol{l}|^{\frac{1}{2}}), \quad |\boldsymbol{l}|^r \leq C_r(|\boldsymbol{j}|^r + |\boldsymbol{k}|^r).
$$

Thanks to the Cauchy-Schwarz inequality, since  $r > \frac{3}{2}$ , we have

$$
B_{1} = \int_{0}^{1} \sum_{j+k+l=0} C_{r} |k|^{\frac{1}{2}} |j|^{r+\frac{1}{2}} |l|^{r} e^{\tau |j|} e^{\tau |k|} e^{\tau |l|} \Big( \int_{0}^{z} |\hat{f}_{j}(s)| ds \Big) |\partial_{z} \hat{g}_{k}(z)| |\hat{h}_{l}(z)| dz
$$
  
\n
$$
= C_{r} \int_{0}^{1} \sum_{\substack{k \in 2\pi \mathbb{Z}^{2} \\ k \neq 0}} \Big[ |k|^{\frac{1}{2}} |\partial_{z} \hat{g}_{k}(z)| e^{\tau |k|} \sum_{j \in 2\pi \mathbb{Z}^{2}} |j|^{r+\frac{1}{2}} e^{\tau |j|} \Big( \int_{0}^{z} |\hat{f}_{j}(s)| ds \Big) |j+k|^{r} e^{\tau |j+k|} |\hat{h}_{-j-k}(z)| \Big] dz
$$
  
\n

$$

The estimate of  $B_3$  is similar to that of  $B_1$ , and one can obtain that

$$
B_3 \le C_r \|A^{r+\frac{1}{2}} e^{\tau A} f\| \|A^r e^{\tau A} \partial_z g\| \|A^r e^{\tau A} h\|.
$$

Combine the estimates of  $B_1$ ,  $B_2$ , and  $B_3$ , we obtain the desired result.  $\Box$ 

<span id="page-39-1"></span>**Lemma A.3.** *For*  $f, g, h \in S_{r+\frac{1}{2},s,\tau}$ *, where*  $r > 1$ *,*  $s \geq 0$ *, and*  $\tau \geq 0$ *, one has* 

$$
\left| \left\langle A^r e^{\tau A} ((\nabla \cdot f) g), A^r e^{\tau A} h \right\rangle \right|
$$
  
\n
$$
\leq \int_0^1 C_r \left[ ( \|A^r e^{\tau A} g(z)\|_{L^2(\mathbb{T}^2)} + |\hat{g}_0(z)|) \|A^{r+\frac{1}{2}} e^{\tau A} f(z)\|_{L^2(\mathbb{T}^2)} \|A^{r+\frac{1}{2}} e^{\tau A} h(z)\|_{L^2(\mathbb{T}^2)} \right. \\ \left. + \|A^{r+\frac{1}{2}} e^{\tau A} f(z)\|_{L^2(\mathbb{T}^2)} \|A^{r+\frac{1}{2}} e^{\tau A} g(z)\|_{L^2(\mathbb{T}^2)} \|A^r e^{\tau A} h(z)\|_{L^2(\mathbb{T}^2)} \right] dz.
$$

The proof of Lemma [A.3](#page-39-1) is almost the same as Lemma [A.1,](#page-35-0) so we omit it.

<span id="page-39-0"></span>We will show lemmas which are essential in the study of effect of rotation. Lemma [A.4](#page-39-0) to Lemma [A.6](#page-41-0) are concerning the commutator estimates.

**Lemma A.4.** *For*  $f, g, h \in S_{r+\frac{1}{2},s,\tau}$ *, where*  $r > 2$ *,*  $s \ge 0$ *, and*  $\tau \ge 0$ *, one has* 

$$
\left| \left\langle A^r e^{\tau A} (f \cdot \nabla g), A^r e^{\tau A} h \right\rangle - \left\langle f \cdot \nabla A^r e^{\tau A} g, A^r e^{\tau A} h \right\rangle \right|
$$
  
\n
$$
\leq C_r \int_0^1 \|A^r f(z)\|_{L^2(\mathbb{T}^2)} \|A^r g(z)\|_{L^2(\mathbb{T}^2)} \|A^r h(z)\|_{L^2(\mathbb{T}^2)} dz
$$
  
\n
$$
+ C_r \tau \int_0^1 \|A^{r+\frac{1}{2}} e^{\tau A} f(z)\|_{L^2(\mathbb{T}^2)} \|A^{r+\frac{1}{2}} e^{\tau A} g(z)\|_{L^2(\mathbb{T}^2)} \|A^{r+\frac{1}{2}} e^{\tau A} h(z)\|_{L^2(\mathbb{T}^2)} dz.
$$

Next, we have

**Lemma A.5.** *For*  $f, g, h \in S_{r+\frac{1}{2},s,\tau}$ , where  $r > 2$ ,  $s \ge 0$ , and  $\tau \ge 0$ , one has

<span id="page-39-2"></span>
$$
\left| \left\langle A^r e^{\tau A} ((\nabla \cdot f)g), A^r e^{\tau A} h \right\rangle - \left\langle (\nabla \cdot A^r e^{\tau A} f)g, A^r e^{\tau A} h \right\rangle \right|
$$
  
\n
$$
\leq C_r \int_0^1 \|A^r f(z)\|_{L^2(\mathbb{T}^2)} \|A^r g(z)\|_{L^2(\mathbb{T}^2)} \|A^r h(z)\|_{L^2(\mathbb{T}^2)} dz
$$
  
\n
$$
+ C_r \tau \int_0^1 \|A^{r + \frac{1}{2}} e^{\tau A} f(z)\|_{L^2(\mathbb{T}^2)} \|A^{r + \frac{1}{2}} e^{\tau A} g(z)\|_{L^2(\mathbb{T}^2)} \|A^{r + \frac{1}{2}} e^{\tau A} h(z)\|_{L^2(\mathbb{T}^2)} dz.
$$

We start with the proof of Theorem [A.4.](#page-39-0) The proof of Theorem [A.5](#page-39-2) will be similarly.

*Proof of Lemma [A.4.](#page-39-0)* First, notice that  $\left| \int_{a}^{b} \tilde{f}(a) dV \right|$  $\left\langle A^r e^{\tau A} (f \cdot \nabla g), A^r e^{\tau A} h \right\rangle =$  $\left\langle f \cdot \nabla g, A^r e^{\tau A} H \right\rangle$ , where  $H =$  $A^r e^{\tau A} h$ . We use Fourier representation of f, g and H, in which we can write

$$
f(\mathbf{x}, z) = \sum_{j \in 2\pi\mathbb{Z}^2} \hat{f}_j(z) e^{ij \cdot \mathbf{x}},
$$
  
\n
$$
g(\mathbf{x}, z) = \sum_{k \in 2\pi\mathbb{Z}^2} \hat{g}_k(z) e^{ik \cdot \mathbf{x}},
$$
  
\n
$$
A^r e^{\tau A} H(\mathbf{x}, z) = \sum_{l \in 2\pi\mathbb{Z}^2} |l|^r e^{\tau |l|} \hat{H}_l(z) e^{il \cdot \mathbf{x}}.
$$

Therefore,

$$
I := \left| \left\langle A^r e^{\tau A} (f \cdot \nabla g), A^r e^{\tau A} h \right\rangle - \left\langle f \cdot \nabla A^r e^{\tau A} g, A^r e^{\tau A} h \right\rangle \right|
$$
  
=  $\left| \left\langle (f \cdot \nabla g), A^r e^{\tau A} H \right\rangle - \left\langle f \cdot \nabla A^r e^{\tau A} g, H \right\rangle \right|$ 

$$
\leq \sum_{j+k+l=0} \int_0^1 |\hat{f}_j(z)||\mathbf{k}||\hat{g}_k(z)||\hat{H}_l(z)||\mathbf{l}|^r e^{\tau|\mathbf{l}|} - |\mathbf{k}|^r e^{\tau|\mathbf{k}|} dz.
$$

By virtue of the following observation [\[40\]](#page-43-20):

For  $r \ge 1$  and  $\tau \ge 0$ , and for all positive  $\xi, \eta \in \mathbb{R}$ , we have

<span id="page-40-0"></span>
$$
|\xi^r e^{\tau\xi} - \eta^r e^{\tau\eta}| \le C_r |\xi - \eta| \left( |\xi - \eta|^{r-1} + \eta^{r-1} + \tau(|\xi - \eta|^r + \eta^r) e^{\tau|\xi - \eta|} e^{\tau\eta} \right);
$$
(A.3)

with  $\xi = |\boldsymbol{l}|, \eta = |\boldsymbol{k}|,$  and  $|\xi - \eta| \leq |\boldsymbol{j}|$ , inequality [\(A.3\)](#page-40-0) implies

$$
I \leq C_r \sum_{j+k+l=0} \int_0^1 |\hat{f}_j(z)||\mathbf{k}||\hat{g}_k(z)||\hat{H}_l(z)||j| \Big(|\mathbf{j}|^{r-1} + |\mathbf{k}|^{r-1} + \tau(|\mathbf{j}|^r + |\mathbf{k}|^r) e^{\tau|\mathbf{j}|} e^{\tau|\mathbf{k}|}\Big) dz.
$$

By the definition of H, and since  $e^x \leq 1 + xe^x$  for any  $x \geq 0$ , we have

$$
|\hat{H}_l(z)| = |l|^r e^{\tau |l|} |\hat{h}_l(z)| \le |l|^r (1 + \tau |l| e^{\tau |l|}) |\hat{h}_l(z)| \le |l|^r |\hat{h}_l(z)| + \tau (|j| + |k|) |\hat{H}_l(z)|.
$$

Therefore, one obtains that

$$
|\hat{H}_l(z)|(|j|^{r-1}+|k|^{r-1}+\tau(|j|^r+|k|^r)e^{\tau|k|}e^{\tau|j|})
$$
  
\n
$$
\leq (|l|^r|\hat{h}_l(z)|+\tau(|j|+|k|)|\hat{H}_l(z)|)(|k|^{r-1}+|j|^{r-1})+|\hat{H}_l(z)|(\tau(|k|^r+|j|^r)e^{\tau|k|}e^{\tau|j|})
$$
  
\n
$$
\leq |\hat{h}_l(z)||l|^r(|k|^{r-1}+|j|^{r-1})+\tau C_r|\hat{H}_l(z)|(|k|^r+|j|^r)e^{\tau|k|}e^{\tau|j|}.
$$

Based on this, one has

$$
I \leq C_r \sum_{j+k+l=0} \int_0^1 |\hat{f}_j(z)||\mathbf{k}||\hat{g}_k(z)||j||\hat{h}_l(z)||\mathbf{l}|^r(|\mathbf{k}|^{r-1} + |\mathbf{j}|^{r-1})dz
$$
  
+
$$
+ \tau C_r \sum_{j+k+l=0} \int_0^1 |\hat{f}_j(z)||\mathbf{k}||\hat{g}_k(z)||\mathbf{j}||\hat{H}_l(z)|(|\mathbf{k}|^r + |\mathbf{j}|^r)e^{\tau|\mathbf{k}|}e^{\tau|\mathbf{j}|}dz := I_1 + I_2.
$$

Here

$$
I_1 = C_r \sum_{\mathbf{j}+\mathbf{k}+\mathbf{l}=0} \int_0^1 \left( |\hat{f}_\mathbf{j}(z)||\mathbf{k}|^r |\hat{g}_\mathbf{k}(z)||\mathbf{j}| |\hat{h}_\mathbf{l}(z)||\mathbf{l}|^r + |\hat{f}_\mathbf{j}(z)||\mathbf{k}| |\hat{g}_\mathbf{k}(z)||\mathbf{j}|^r |\hat{h}_\mathbf{l}(z)||\mathbf{l}|^r \right) dz := \int_0^1 I_{11} + I_{12} dz.
$$

Thanks to Cauchy-Schwarz inequality, since  $r > 2$ , we have

$$
I_{11} = C_r \sum_{j+k+l=0} |j||\hat{f}_j(z)||\mathbf{k}|^r |\hat{g}_k(z)||l|^r |\hat{h}_l(z)|
$$
  
\n
$$
= C_r \sum_{\substack{j \in 2\pi \mathbb{Z}^2 \\ j \neq 0}} |j||\hat{f}_j(z)| \sum_{\substack{k \in 2\pi \mathbb{Z}^2 \\ k \neq 0, -j}} |\mathbf{k}|^r |\hat{g}_k(z)||j + \mathbf{k}|^r |\hat{h}_{-j-k}(z)|
$$
  
\n
$$
\leq C_r \Big( \sum_{\substack{j \in 2\pi \mathbb{Z}^2 \\ j \neq 0}} |j|^{2-2r} \Big)^{\frac{1}{2}} \Big( \sum_{\substack{j \in 2\pi \mathbb{Z}^2 \\ j \neq 0}} |j|^{2r} |\hat{f}_j(z)|^2 \Big)^{\frac{1}{2}}
$$
  
\n
$$
\times \sup_{\substack{j \in 2\pi \mathbb{Z}^2 \\ k \neq 0, -j}} \Big( \sum_{\substack{k \in 2\pi \mathbb{Z}^2 \\ k \neq 0, -j}} |k|^{2r} |\hat{g}_k(z)|^2 \Big)^{\frac{1}{2}} \Big( \sum_{\substack{k \in 2\pi \mathbb{Z}^2 \\ k \neq 0, -j}} |j + k|^{2r} |\hat{h}_{-j-k}(z)|^2 \Big)^{\frac{1}{2}}
$$
  
\n
$$
\leq C_r ||A^r f(z)||_{L^2(\mathbb{T}^2)} ||A^r g(z)||_{L^2(\mathbb{T}^2)} ||A^r h(z)||_{L^2(\mathbb{T}^2)}.
$$

Similarly, one gets

$$
I_{12} \leq C_r \|A^r f(z)\|_{L^2(\mathbb{T}^2)} \|A^r g(z)\|_{L^2(\mathbb{T}^2)} \|A^r h(z)\|_{L^2(\mathbb{T}^2)}.
$$

Therefore,

$$
I_1 \leq C_r \int_0^1 \|A^r f(z)\|_{L^2(\mathbb{T}^2)} \|A^r g(z)\|_{L^2(\mathbb{T}^2)} \|A^r h(z)\|_{L^2(\mathbb{T}^2)} dz.
$$

Next, we estimate

$$
I_2 = \tau C_r \sum_{j+k+l=0} \int_0^1 (|j|^{r+1} e^{\tau |j|} |\hat{f}_j(z)||k| e^{\tau |k|} |\hat{g}_k(z)||\hat{H}_l(z)|
$$
  
+ |j| e^{\tau |j|} |\hat{f}\_j(z)||k|^{r+1} e^{\tau |k|} |\hat{g}\_k(z)||\hat{H}\_l(z)| dt = \int\_0^1 I\_{21} + I\_{22} dz.

Thanks to Cauchy-Schwarz inequality, since  $r > 2$ , by using  $|\boldsymbol{j}|^{\frac{1}{2}} \leq |\boldsymbol{k}|^{\frac{1}{2}} + |\boldsymbol{l}|^{\frac{1}{2}}$ , and  $|\boldsymbol{k}|^{\frac{1}{2}} + |\boldsymbol{l}|^{\frac{1}{2}} \leq 2|\boldsymbol{k}|^{\frac{1}{2}}|\boldsymbol{l}|^{\frac{1}{2}}$ when  $|\mathbf{k}| \geq 1$  and  $|\mathbf{l}| \geq 1$ , we have

$$
I_{21} = \tau C_r \sum_{j+k+l=0} |j|^{r+1} e^{\tau |j|} |\hat{f}_j(z)||k| e^{\tau |k|} |\hat{g}_k(z)||\hat{H}_l(z)|
$$
  
\n
$$
\leq \tau C_r \sum_{j+k+l=0} |j|^{r+\frac{1}{2}} e^{\tau |j|} |\hat{f}_j(z)||k|^{\frac{3}{2}} e^{\tau |k|} |\hat{g}_k(z)||l|^{r+\frac{1}{2}} e^{\tau |l|} |\hat{h}_l(z)|
$$
  
\n
$$
\leq C_r \tau \sum_{k \in 2\pi \mathbb{Z}^2} |k|^{\frac{3}{2}} |\hat{g}_k(z)| e^{\tau |k|} \sum_{\substack{j \in 2\pi \mathbb{Z}^2 \\ j \neq 0, -k}} |j|^{r+\frac{1}{2}} e^{\tau |j|} |\hat{f}_j(z)||j+k|^{r+\frac{1}{2}} e^{\tau |j+k|} |\hat{h}_{-j-k}(z)|
$$
  
\n
$$
\leq C_r \tau \Big( \sum_{\substack{k \in 2\pi \mathbb{Z}^2 \\ k \neq 0}} |k|^{2-2r} \Big)^{\frac{1}{2}} \Big( \sum_{\substack{k \in 2\pi \mathbb{Z}^2 \\ k \neq 0}} |k|^{2r+1} e^{2\tau |k|} |\hat{g}_k(z)|^2 \Big)^{\frac{1}{2}}
$$
  
\n
$$
\times \sup_{k \in 2\pi \mathbb{Z}^2} \Big( \sum_{\substack{j \in 2\pi \mathbb{Z}^2 \\ j \neq 0, -k}} |j|^{2r+1} e^{2\tau |j|} |\hat{f}_j(z)|^2 \Big)^{\frac{1}{2}} \Big( \sum_{\substack{j \in 2\pi \mathbb{Z}^2 \\ j \neq 0, -k}} |j+k|^{2r+1} e^{2\tau |j+k|} |\hat{h}_{-j-k}(z)|^2 \Big)^{\frac{1}{2}}
$$
  
\n
$$
\leq C_r \tau \|A^{r+\frac{1}{2}} e^{\tau A} f(z) \|_{L^2(\mathbb{T}^2)} \|A^{r+\frac{1}{2}} e^{\tau A} g(z)\|_{L^2(\mathbb{T}^2)} \|A^{r+\frac{1}{2}} e^{\tau A} h(z) \|_{L^
$$

Similarly, one gets

$$
I_{22} \leq C_r \tau \|A^{r+\frac{1}{2}} e^{\tau A} f(z)\|_{L^2(\mathbb{T}^2)} \|A^{r+\frac{1}{2}} e^{\tau A} g(z)\|_{L^2(\mathbb{T}^2)} \|A^{r+\frac{1}{2}} e^{\tau A} h(z)\|_{L^2(\mathbb{T}^2)}.
$$

Therefore,

$$
I_2 \leq C_r \tau \int_0^1 \|A^{r+\frac{1}{2}} e^{\tau A} f(z)\|_{L^2(\mathbb{T}^2)} \|A^{r+\frac{1}{2}} e^{\tau A} g(z)\|_{L^2(\mathbb{T}^2)} \|A^{r+\frac{1}{2}} e^{\tau A} h(z)\|_{L^2(\mathbb{T}^2)} dz.
$$

 $\Box$ 

<span id="page-41-0"></span>**Lemma A.6.** *For*  $f, g, \partial_z g, h \in S_{r+\frac{1}{2},s,\tau}$ , where  $r > 2$ ,  $s \ge 0$ , and  $\tau \ge 0$ , one has

$$
\left| \left\langle A^r e^{\tau A} \left( (\int_0^z \nabla \cdot f(\mathbf{x}, s) ds) \partial_z g \right), A^r e^{\tau A} h \right\rangle - \left\langle \partial_z g A^r e^{\tau A} (\int_0^z \nabla \cdot f(\mathbf{x}, s) ds), A^r e^{\tau A} h \right\rangle \right|
$$
  
\n
$$
\leq C_r \|A^r \partial_z g\| \|A^r f\| \|A^r h\| + C_r \tau \|A^{r + \frac{1}{2}} e^{\tau A} \partial_z g\| \|A^{r + \frac{1}{2}} e^{\tau A} f\| \|A^{r + \frac{1}{2}} e^{\tau A} h\|.
$$

*Proof.* Observe that Lemma [A.6](#page-41-0) follows directly from Lemma [A.5.](#page-39-2) Indeed, if one replaces f by  $\int_0^z f(x, s) ds$ and g by  $\partial_z g$  in Lemma [A.5,](#page-39-2) by the Hölder inequality, one obtains that

$$
\left| \left\langle A^r e^{\tau A} \left( \left( \int_0^z \nabla \cdot f(x, s) ds \right) \partial_z g \right), A^r e^{\tau A} h \right\rangle - \left\langle \partial_z g A^r e^{\tau A} \left( \int_0^z \nabla \cdot f(x, s) ds \right), A^r e^{\tau A} h \right\rangle \right|
$$
  
\n
$$
\leq C_r \int_0^1 \| A^r \int_0^z f(x, s) ds \|_{L^2(\mathbb{T}^2)} \| A^r \partial_z g(z) \|_{L^2(\mathbb{T}^2)} \| A^r h(z) \|_{L^2(\mathbb{T}^2)} dz
$$
  
\n
$$
+ C_r \tau \int_0^1 \| A^{r + \frac{1}{2}} e^{\tau A} \int_0^z f(x, s) ds \|_{L^2(\mathbb{T}^2)} \| A^{r + \frac{1}{2}} e^{\tau A} \partial_z g(z) \|_{L^2(\mathbb{T}^2)} \| A^{r + \frac{1}{2}} e^{\tau A} h(z) \|_{L^2(\mathbb{T}^2)} dz
$$
  
\n
$$
\leq C_r \| A^r \partial_z g \| \| A^r f \| \| A^r h \| + C_r \tau \| A^{r + \frac{1}{2}} e^{\tau A} \partial_z g \| \| A^{r + \frac{1}{2}} e^{\tau A} f \| \| A^{r + \frac{1}{2}} e^{\tau A} h \|.
$$
