These papers are preliminary in nature; their purpose is to stimulate discussion and comment. Therefore, they are not to be cited or quoted in any publication without the express permission of the author.

GRADUATE SCHOOL OF BUSINESS ADMINISTRATION

**CENTER FOR REAL ESTATE AND URBAN ECONOMICS
UNIVERSITY OF CALIFORNIA, BERKELEY**

The Center was established in 1950 to examine in depth a series of major changes and issues involving urban land and real estate markets. The Center is supported by both private contributions from industry sources and by appropriations allocated from the Real Estate Education and Research Fund of the State of California.

**INSTITUTE OF BUSINESS AND ECONOMIC RESEARCH
J. W. Garbarino, Director**

The Institute of Business and Economic Research is a department of the University of California with offices on the Berkeley campus. It exists for the purpose of stimulating and facilitating research into problems of economics and of business with emphasis on problems of particular importance to California and the Pacific Coast, but not to the exclusion of problems of wider import.

California Housing Profiles: 1980

The California Market Data Cooperative

March 1982

Working Paper No. 82-44
Center for Real Estate and Urban Economics

Introduction

Welcome to the first edition of "California Housing Profiles: 1980", a set of summary tables intended for use by teachers and students, consultants, and housing market researchers. The summary tables, organized by county, were assembled from individual housing unit sales data collected by members of the California Society of Real Estate Appraisers (SREA), and compiled by the California Market Data Cooperative.

The reports cover only owner-occupied homes. The data is further broken down by structure type. The majority of units in each county are typically detached single-family (1-family) homes. A second separate category includes townhouse units (tn-house), an increasingly popular mixture of detached and common-wall characteristics. The townhouse designation typically includes duplex, tri-plex, and four-plex structures. The category, other, includes owner-occupied row houses, flats, garden apartments, zero-lot-line units, and high-rise apartments. The precise classifications of the various structure types were made by the realtor/loan officer who recorded the sale for the SREA. Thus far we have found no inconsistencies in the classification scheme that would indicate bias.

Each of the three structural types are further divided into new and existing structures. New units are defined as those sold within one year of their completion, all other units are termed existing.

Eight characteristics are reported for each of the structure/tenure types:

- 1) Observations: the number of observations on price within the category

- 2) Average Price
- 3) Bedrooms: the average number of bedrooms in the unit
- 4) Average Age: the average age of the unit
- 5) SQFT: the average living area in the unit, measured in square feet (excluding garage space, but including enclosed porch space)
- 6) Quality: the average appraiser-estimated quality of the unit when constructed (varies from 1 (poor) to 5 (excellent))
- 7) Condition: the average appraiser-estimated condition of the unit when sold (varies from 1 (poor) to 5 (excellent))
- 8) Average Lotsize: the average lotsize of the parcel on which the unit is located

Appendix I includes additional characteristic information.

We offer three additional qualifications:

- 1) Comprehensiveness: The data profiled is not drawn from all observations in a particular county; only those transactions reported through the SREA. Moreover, reporting varies widely within and between counties. As a general rule, the larger the number of observations, the closer the reported estimate to the true average.
- 2) Standard Deviations: Standard deviations of the reported characteristics are listed in parenthesis. In many instances, a standard deviation of "0" is listed even though we report more than one observation. This is due to a problem with the statistical method used to calculate the standard deviation, a method which does not work for large values (typically price, square footage, and lot size). The problem is consistent in the case of price, and occasional for lotsize and square footage. We hope to remedy this problem by next year.
- 3) Uneven Observations: Not all the characteristic averages are drawn from the same number of observations; some transactions are missing key information. The observation matrix printed below the summary table includes the actual observation counts used to determine the characteristic averages and standard deviations.

Despite the technical qualifications presented above, we have great confidence in the usefulness of the data for housing

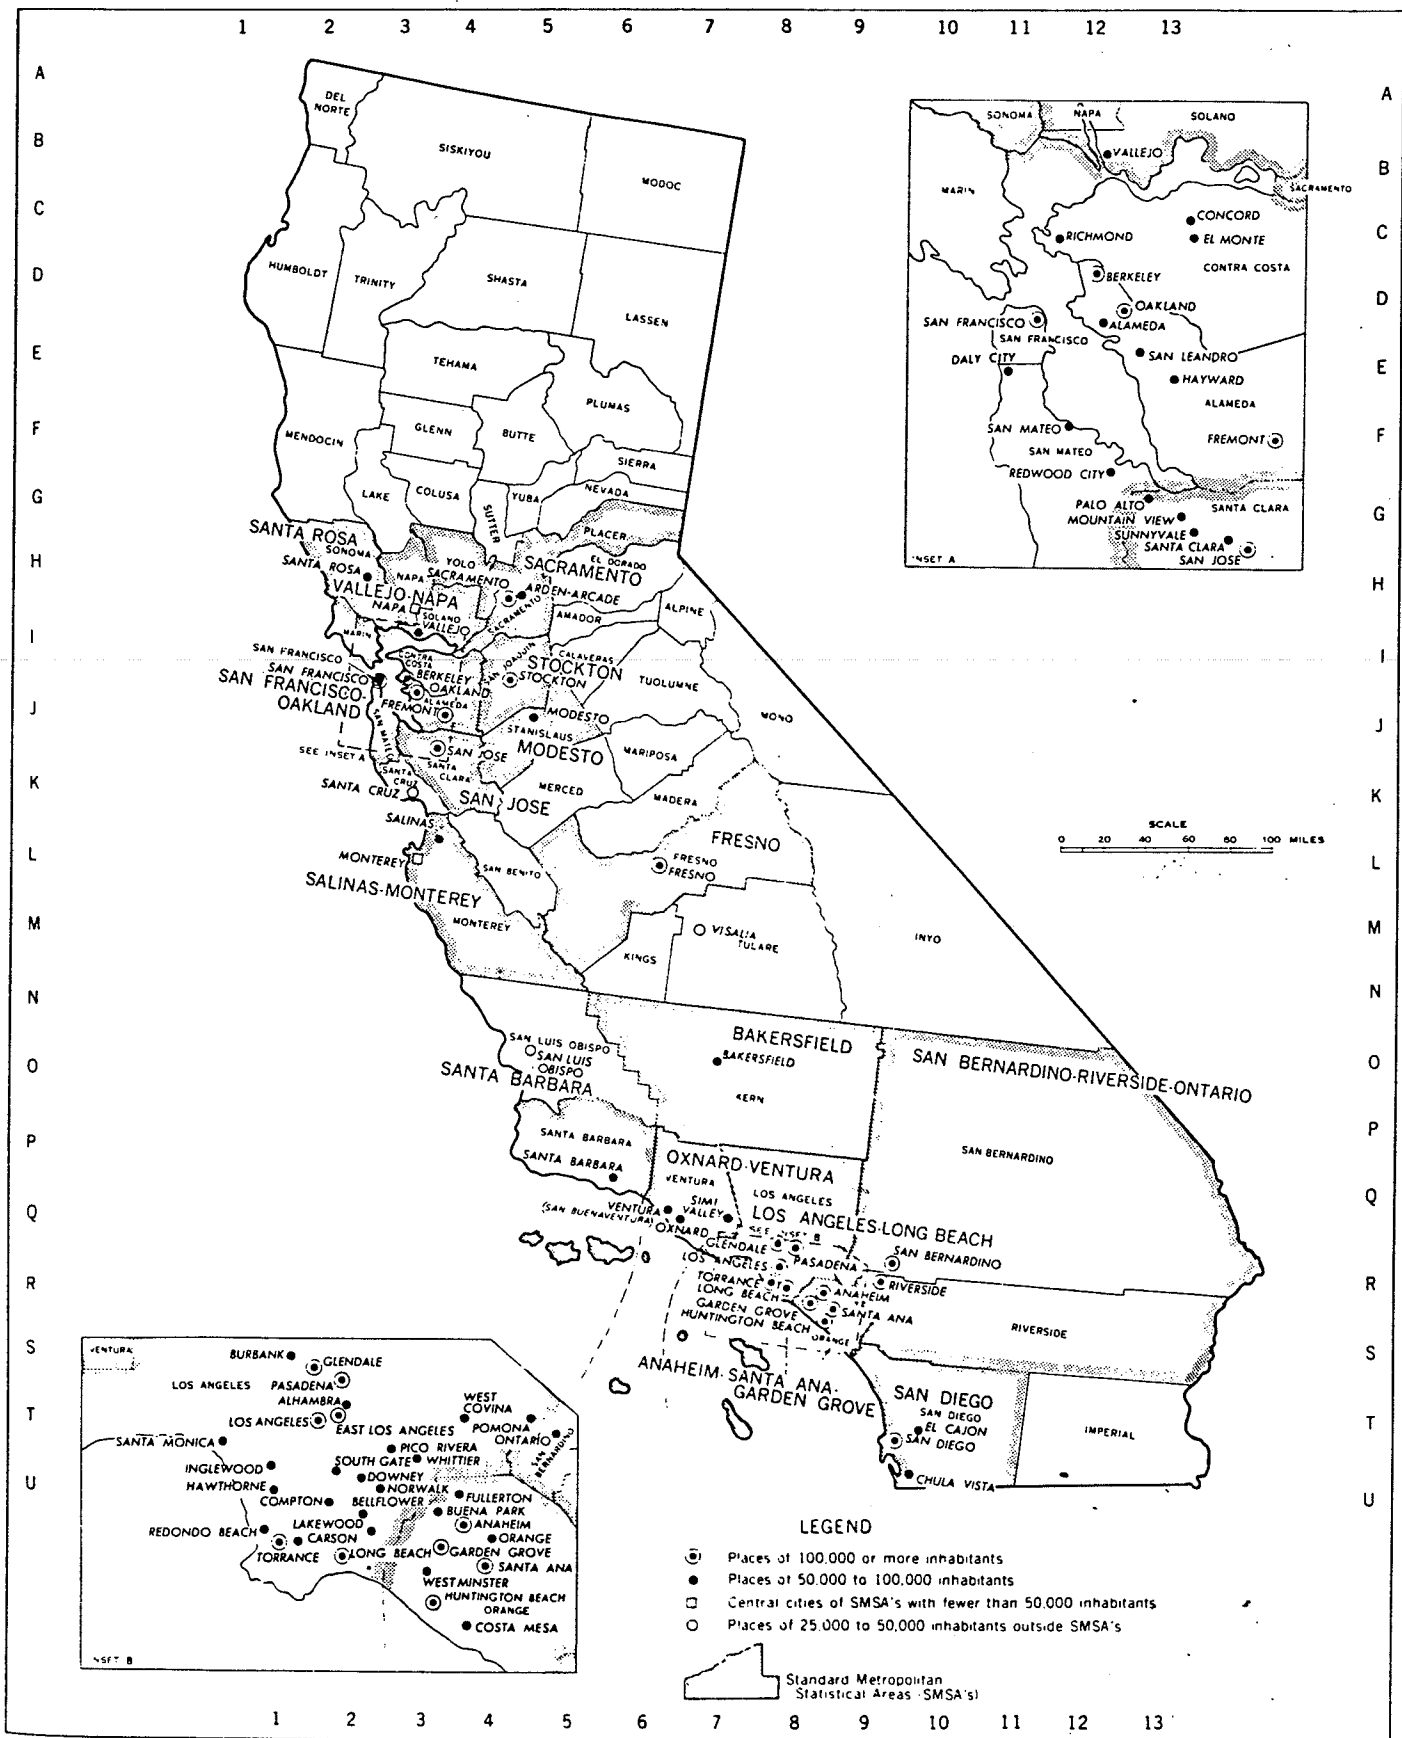

researchers. As a rule, users should be careful primarily when using characteristic averages drawn from a small number of observations.

We hope that these tables will prove useful. We do ask one courtesy, however. When using the data in publishing reports, please reference the Center for Real Estate and Urban Economics and the California Market Data Cooperative.

For further clarification of the tables or any of the issues raised in this introduction, please address all correspondence to:
